

# Enhanced Marine SMFCs for the Biodegradation of a Mixture of Low and High Molecular Weight PAHs

*Hamdan Z. Hamdan; Darine A. Salam*

Department of Civil and Environmental Engineering,  
Faculty of Engineering and Architecture,  
American University of Beirut,  
Beirut, Lebanon

# Definition

- ▶ Sediment microbial fuel cell (SMFC)
  - ▶ Microbial electron transfer
  - ▶ External terminal electron acceptor (TEA)
  - ▶ Exoelectrogens
- ▶ Anode
  - ▶ Anaerobic sediments
  - ▶ TEA
  - ▶ Enhanced organic compounds degradation
- ▶ Cathode
  - ▶ Oxygen rich water
  - ▶ Electrical current
- ▶ Oxygen
  - ▶ Ultimate TEA
  - ▶ Thermodynamic favorability

# Background Information: PAHs Pollution

- ▶ EPA priority pollutant list
  - ▶ PAHs
- ▶ Reluctance to biodegradation
  - ▶ Limitations
- ▶ Marine environment
  - ▶ Limited literature
  - ▶ High sulfate concentrations
  - ▶ Low iron concentration
  - ▶ Microbial community characterization and analysis

# Marine SMFCs Biofilm Characteristics

- ▶ Anode biofilm
  - ▶ Critical factor in understanding and optimizing bioelectrochemical processes
  - ▶ Anode reduction in the case of SMFCs
  - ▶ Careful analysis and understanding of the associated microbes
- ▶ Microbial reduction transition
  - ▶ FeRB not able to outcompete existing microbial populations
  - ▶ Limited abundance
  - ▶ Stable SRB
- ▶ complexity of the sediment microbial structure
  - ▶ Direct impact on success and failure of an anode biofilm
  - ▶ Limited success of SMFC

# Experimental Design

- ▶ FeRB enrichment in marine SMFCs
  - ▶ Deficient in FeRB
- ▶ Bioremediation of a range PAHs
  - ▶ High molecular weight PAHs is very limited
  - ▶ 2-, 3-, 4-, and 5-ringed PAHs
  - ▶ Naphthalene, fluorene, pyrene and BAP
  - ▶ Simulate a complex mixture of PAHs
- ▶ SMFCs operation
  - ▶ Anode reducing conditions
  - ▶ Bacterial sulfate reduction inhibition
  - ▶ Ferric iron stimulation
- ▶ Evolution of microbial populations

# Methodology: Sediment and Seawater

- ▶ Marine sediments
  - ▶ Jiyeh, Lebanon, near the Jiyeh powerplant
  - ▶ 2006 oil spill
    - ▶ 15000 tons of heavy fuel oil
  - ▶ Daily oil contamination
    - ▶ Shipping
    - ▶ Loading/unloading
- ▶ Grab sediment samples
  - ▶ 5-6 meters below the surface
  - ▶ 30 cm below the sediment/water interface
- ▶ Preparation of sediment
  - ▶ PAHs spiking
  - ▶ Iron amendment

# Methodology: SMFC Design

# Methodology: SMFC Operation

Operating condition	Closed/ Open circuit	Iron enrichment	SRB inhibition	Abbreviation	Description
1	Closed	-	-	C.C.	Conventional SMFCs
2	Closed	-	+	SRB inh C.C.	SMFCs operated under closed circuit condition with molybdate addition to inhibit sulfate-reducing bacteria (SRB)
3	Closed	-	-	Abiotic control	Autoclaved plus sodium azide addition
4	Open	-	-	O.C.	Control open circuit
5	Closed	+	-	Fe C.C.	SMFCs operated under closed circuit condition with iron enrichment
6	Closed	+	+	Fe SRB inh CC	SMFCs operated under closed circuit condition with molybdate addition to inhibit sulfate-reducing bacteria (SRB) and iron addition
7	Open	+	-	Fe O.C.	Control SMFCs operated under open circuit conditions with iron enrichment
8	Open	+	+	Fe SRB inh O.C.	Control SMFCs operated under open circuit conditions with iron enrichment and SRB inhibition
9	NA	-	-	Natural attenuation	Natural attenuation control with no brushes

# Methodology: Monitoring

- ▶ Sets of quadruplicates
  - ▶ 1 SMFC per condition sacrificed periodically over 26 weeks
    - ▶ Weeks: 1, 7, 18 and 26
  - ▶ Disassembly process
  - ▶ PAHs → Soxhlet → HPLC
  - ▶ Microbial Analysis → extraction → sequencing (MRDNA)
  - ▶ Sulfates and iron → standard methods
  - ▶ Voltage recording → data acquisition system

# Results: PAHs biodegradation

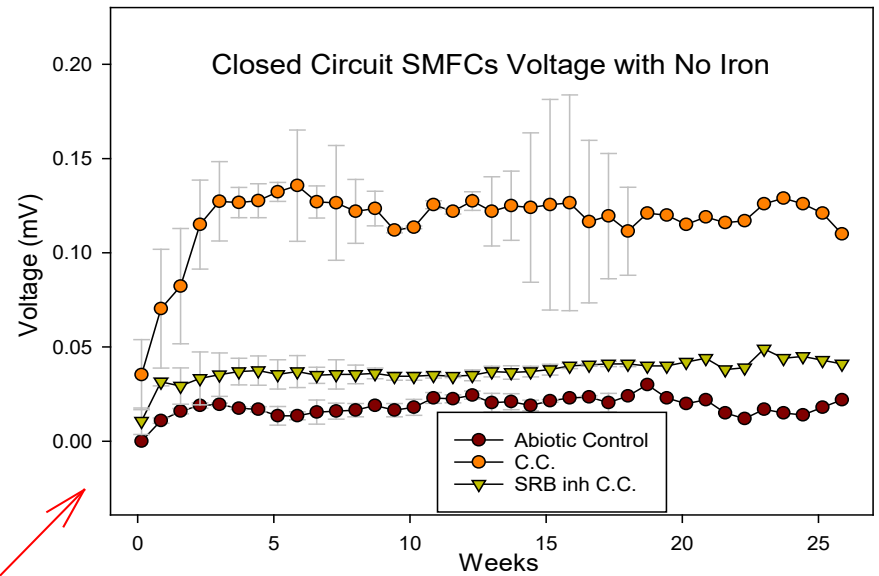

PAHs Removal (%)

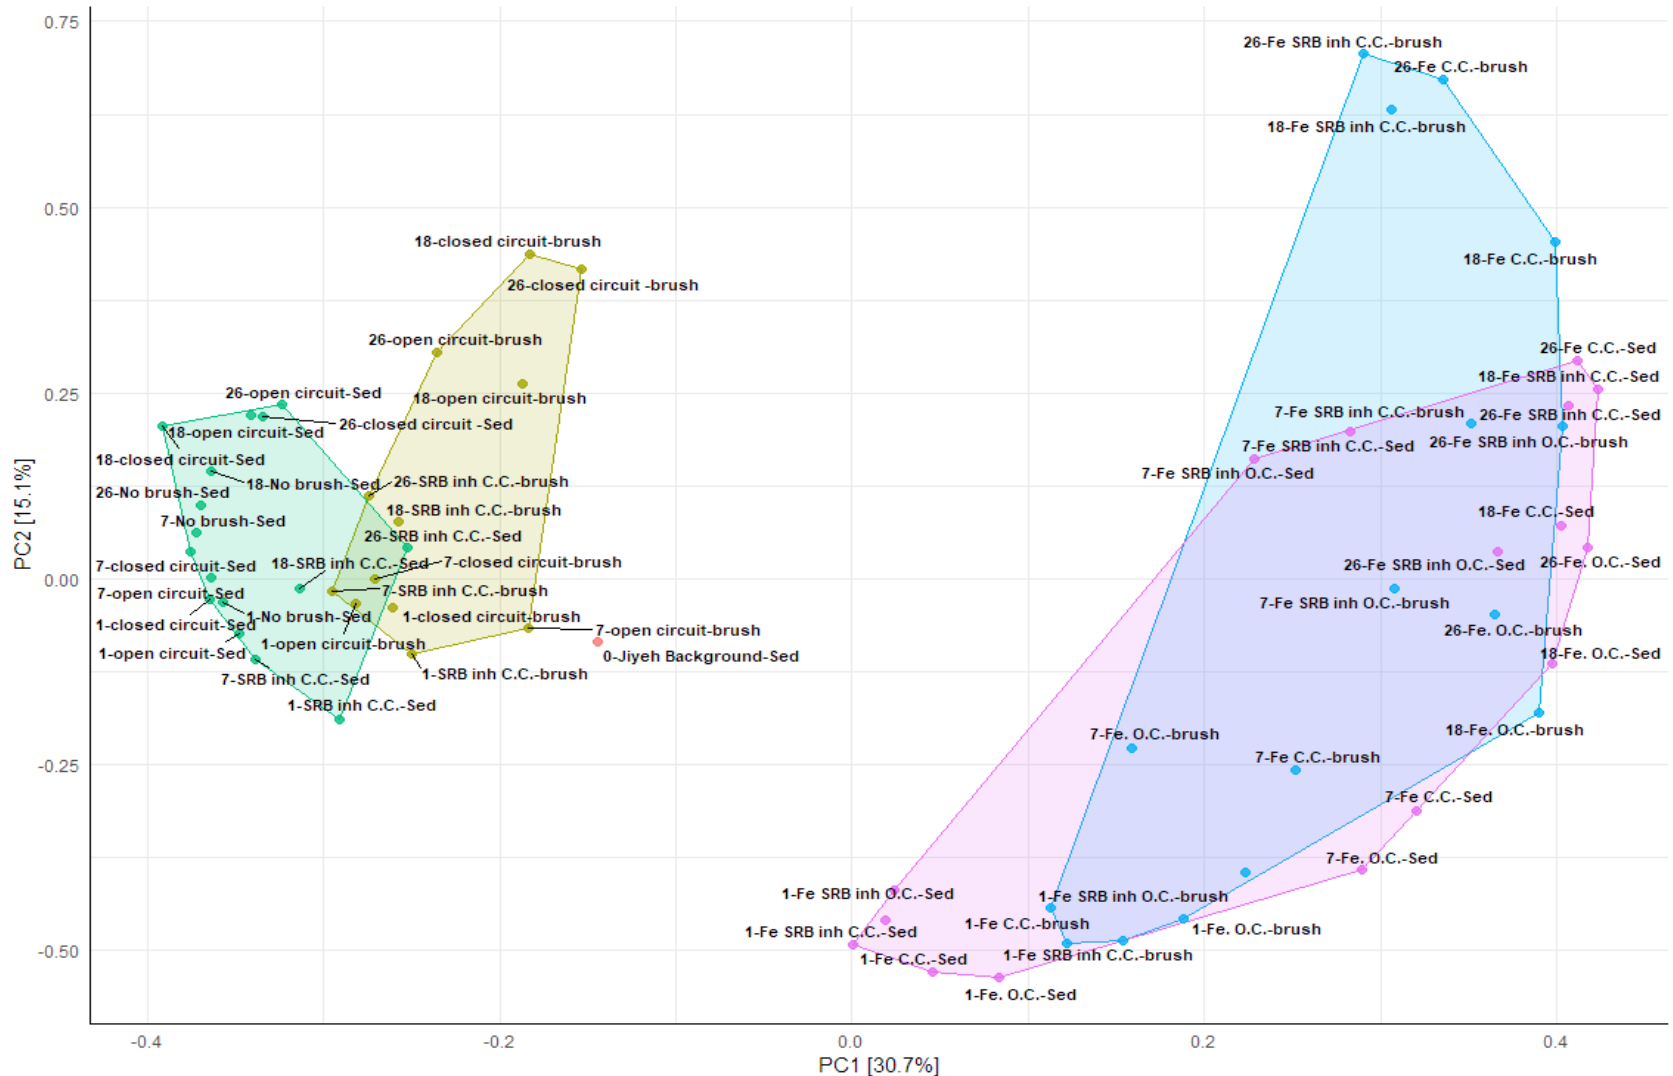

# Results: TEA Utilization

# Results: Voltage

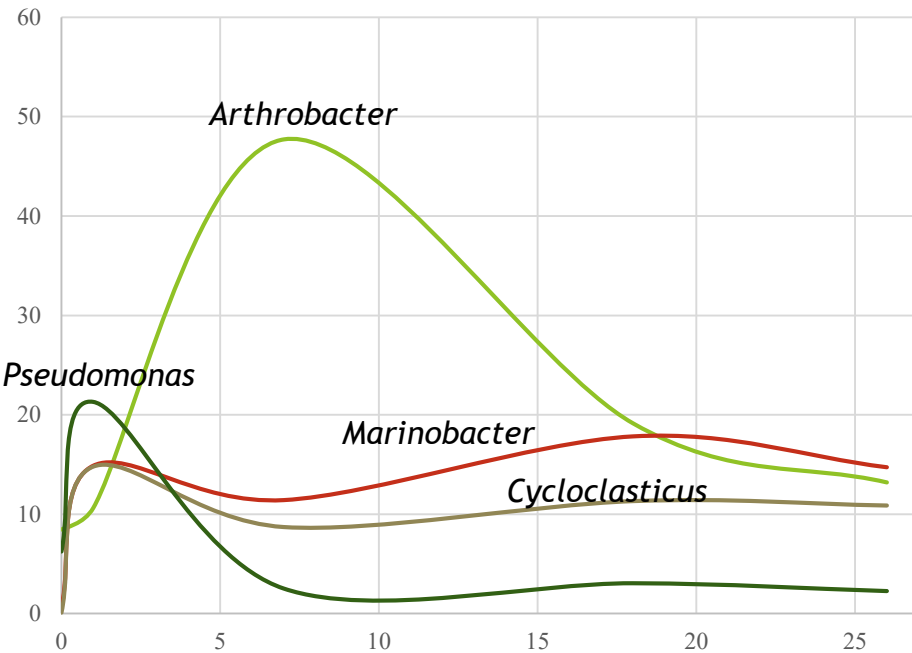

# Results: Microbial Community Analysis Principal Component Analysis (PCA)

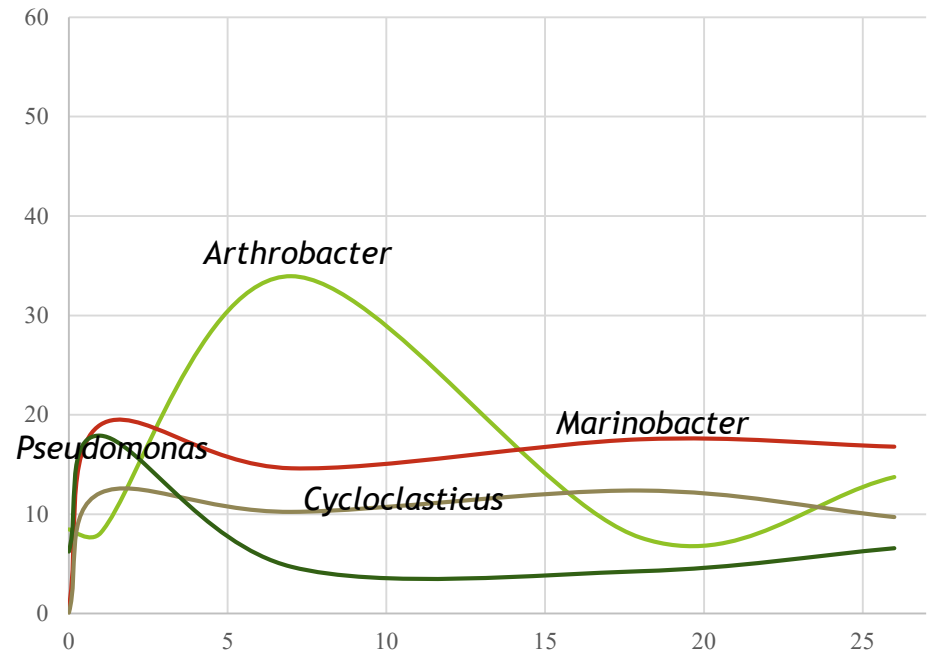

# Results: Microbial Community Analysis

Fe SRB inh C.C.

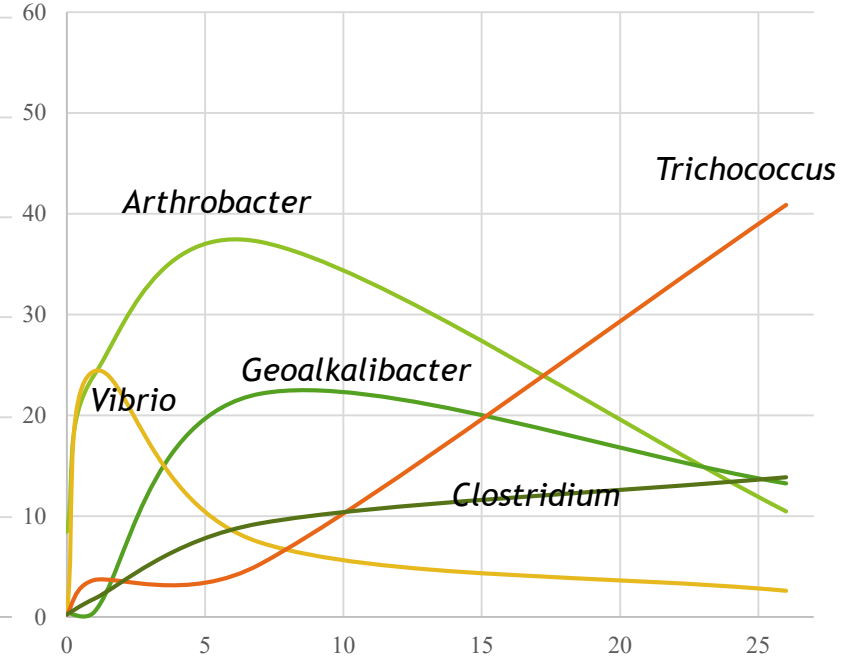

# Results: Microbial Community Analysis

Fe O.C.

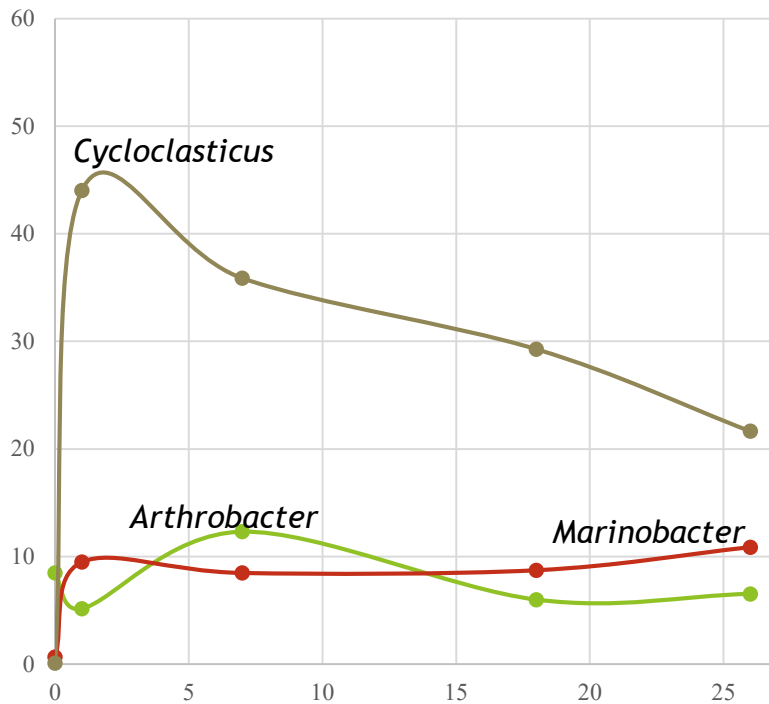

Fe SRB in O.C.

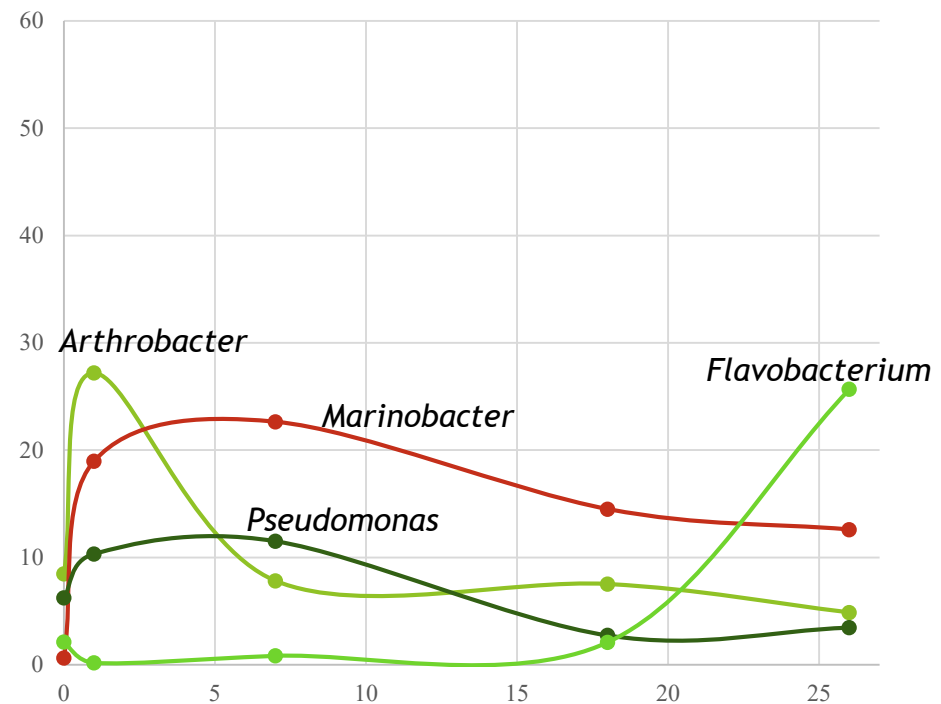

# Results: Microbial Community Analysis

No brush

SRB in C.C.

# Conclusions

- ▶ Ferric iron stimulation in marine
  - ▶ Successful in terms of enriching for electrochemically active microbial populations
    - ▶ Not possible under conventional SMFC
- ▶ Microbial enrichment
  - ▶ Heavily dependent on the sediment characteristics
  - ▶ Type of contamination
  - ▶ Low abundance of iron reducers in marine sediments
- ▶ SRB inhibition
  - ▶ Limited the dominance of sulfate reducers
  - ▶ Better potential for evolving exoelectrogens
  - ▶ 92.5% *Geothalibacter* in anodic biofilm of Fe SRB inh C.C.
- ▶ **However!!!**
  - ▶ PAHs bioremediation potential of marine SMFCs
  - ▶ More correlated to parameters different from simple employment of anode as a TEA
    - ▶ Highest removal was observed in the absence of anode as a TEA, and in the presence of ferric iron stimulation, when SRB communities were inhibited (32% removal)
- ▶ Variation in the microbial community structure
  - ▶ Heavily driven by the operating conditions
  - ▶ Directly related to the observed variation in the performance of the SMFCs
  - ▶ Heavily linked with the removal of PAHs and the generated voltage
- ▶ Results
  - ▶ Better understanding of the ferric iron enrichment in marine settings is needed

# Thank you for listening
