

Application of Selective Reaction Monitoring (SRM) Proteomics to Quantify Reductive Dehalogenase Peptides (RDases) in Microbial Consortium SDC-9

K.H. Kucharzyk, J. Meisel, L. Mullins, M. Michelson, P. B. Hatzinger,
F. E. Löffler, F. K. Murdoch, J. T. Wilson and J. Istock

April 2019
Bioremediation Symposium

Relationship Between 'Omics'

Conventional and Advanced MBTs

A variety of MBTs are available to assist in the following:

- Determine if remediation is working
- Select the appropriate remediation strategy
- Transition from active treatment to MNA
- Include additional lines of evidence

Application of correct MBT to use must be carefully considered taking into account the following objectives:

- What are your goals?
- What type of data will you need?
- Which phase is the site in?
- What is the geochemical data saying (spatial vs temporal)?
- What are your other lines of evidence telling you?

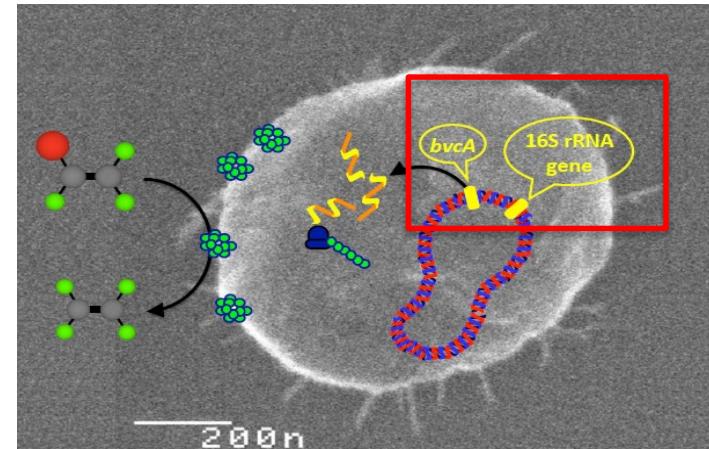

Understanding Biodegradation Rate Is Critical To Site Management

- Measuring biodegradation rates from field samples can be difficult due to:
 - Limited data (sample volume, frequency, replicates)
 - Challenging plume dynamics (insufficient delineation, lithologic heterogeneities, etc.)
- **Proteomic Benefits:**
 - Proteomics can provide additional lines of evidence to further support site recommendations and decision making (e.g., reduction in sampling frequency and/or sampling location(s), elimination of required analytes, site closure, etc..)

DNA-based Molecular Biological Tools Do NOT Provide Quantitative Degradation Rate Information

- qPCR: gene abundance
- Metagenomics (sequence or array)
 - Total microbial community composition
 - Relative gene and/or organism abundance

Proteomics Provides Information on Functional Activity

ORGANISMS

GENES

TRANS-CRIPTS

PROTEINS

ACTIVITY (RATE)

Shotgun

Targeted

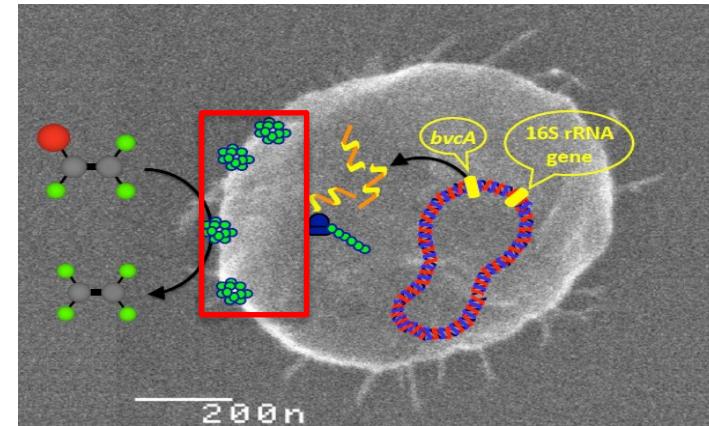

vs.

Discovery/Untargeted Shotgun Proteomics

- Ideal for identification of peptides and post translational modifications
- Global proteome mapping

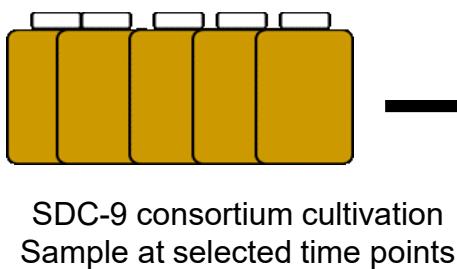

Targeted/Hypothesis Driven Proteomics

- Ideal technique for precise, accurate and reproducible quantification
- Important for large scale projects with large sample sets

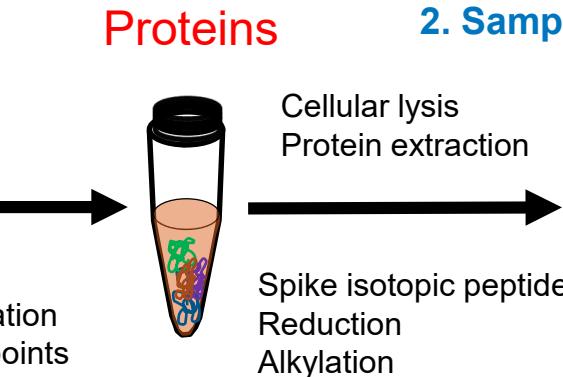

Discovery Proteomics & Peptide Detection

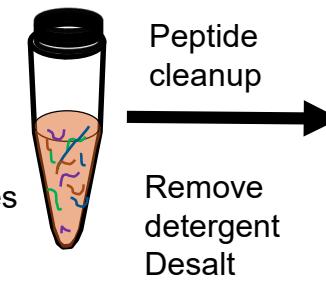

1. Culture Growth and Sample Collection

Proteins

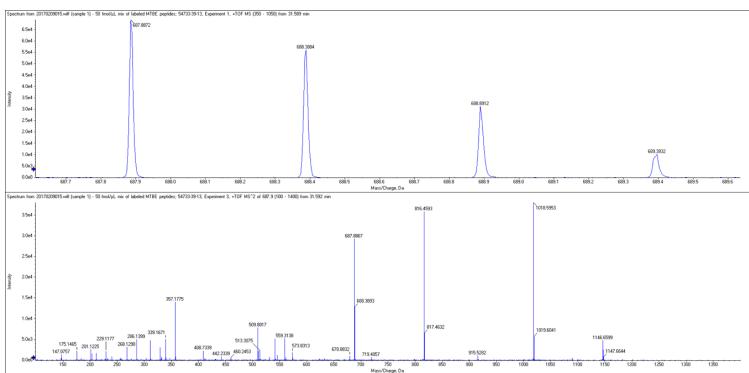

2. Sample Processing

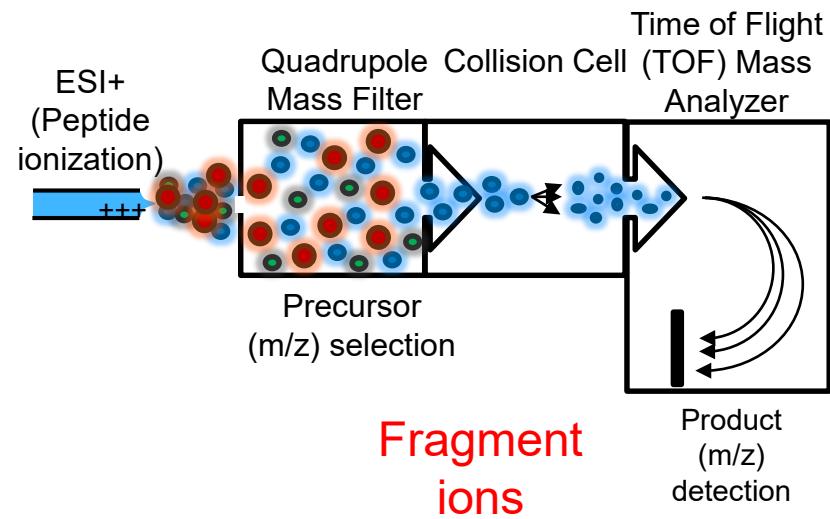

Peptides

4. MS/MS Search & Bioinformatic Analysis

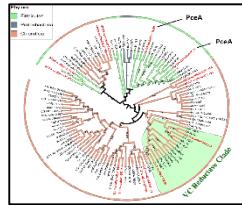

- Identify RDase hits from MS/MS search
- Select peptides specific to RDases
- Build SRM method

3. LC-MS/MS (Quadrupole Time of Flight, qTOF)

Targeted Proteomics & Peptide Detection

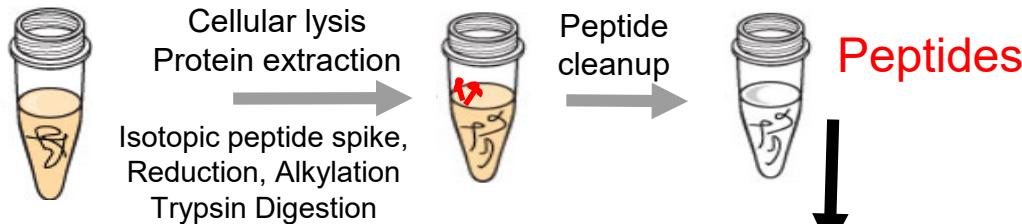

RDase Identification and Down selection

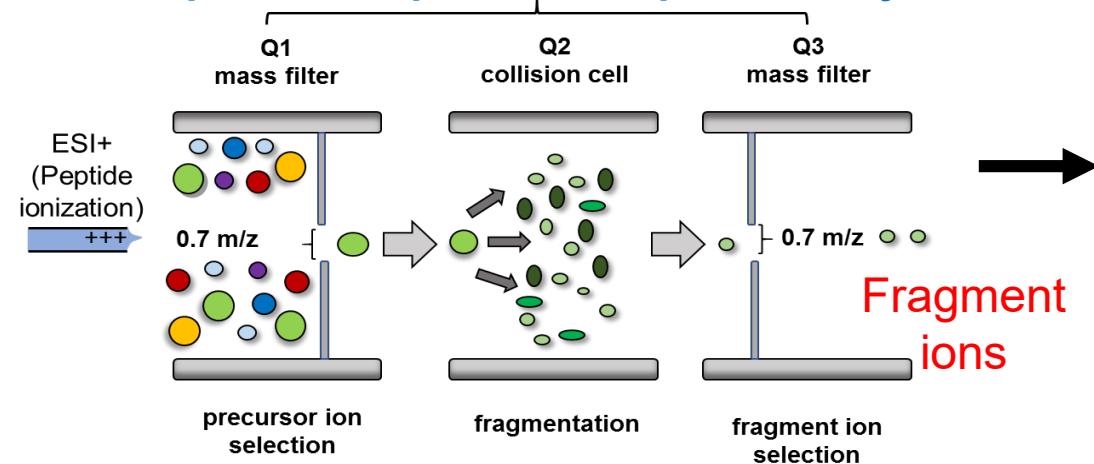

- SDC-9 metagenome sequencing
- Identified a total of 14 RDase gene sequences
- Identified at least 39 unique RDase peptides from the SDC-9 protein digests

Proteins

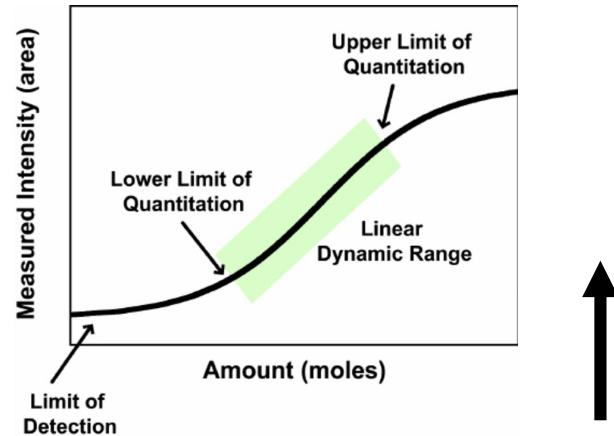

Protein Extraction

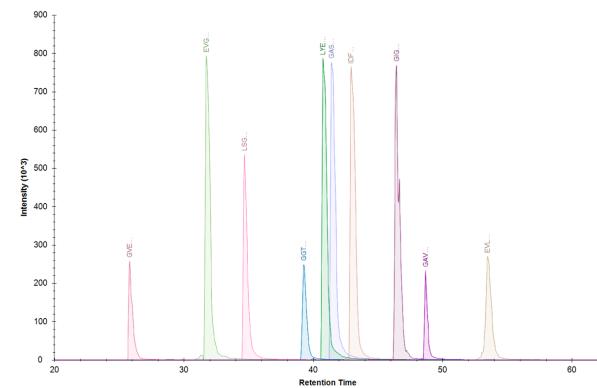

Triple Quadrupole Mass Spectrometry

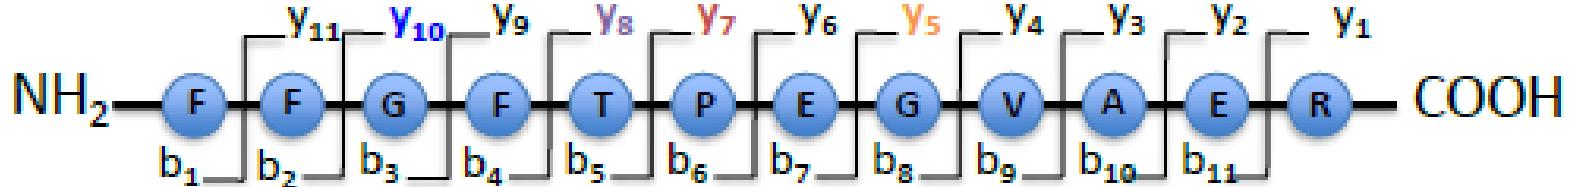

Establish IDL and MDL for Selected Peptide Targets

Bioinformatic Analysis

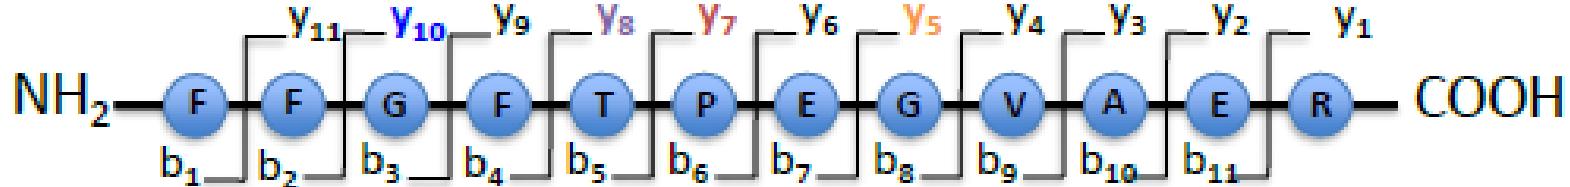

Principle of Data Acquisition

SRM Methods is a Balancing Act

Goal: Achieve the best sensitivity at a high quantitative accuracy with as many proteins as possible!

Maximal multiplexing
Rule of thumb: 4 to 6 transitions per peptide, 3 to 5 peptides per protein

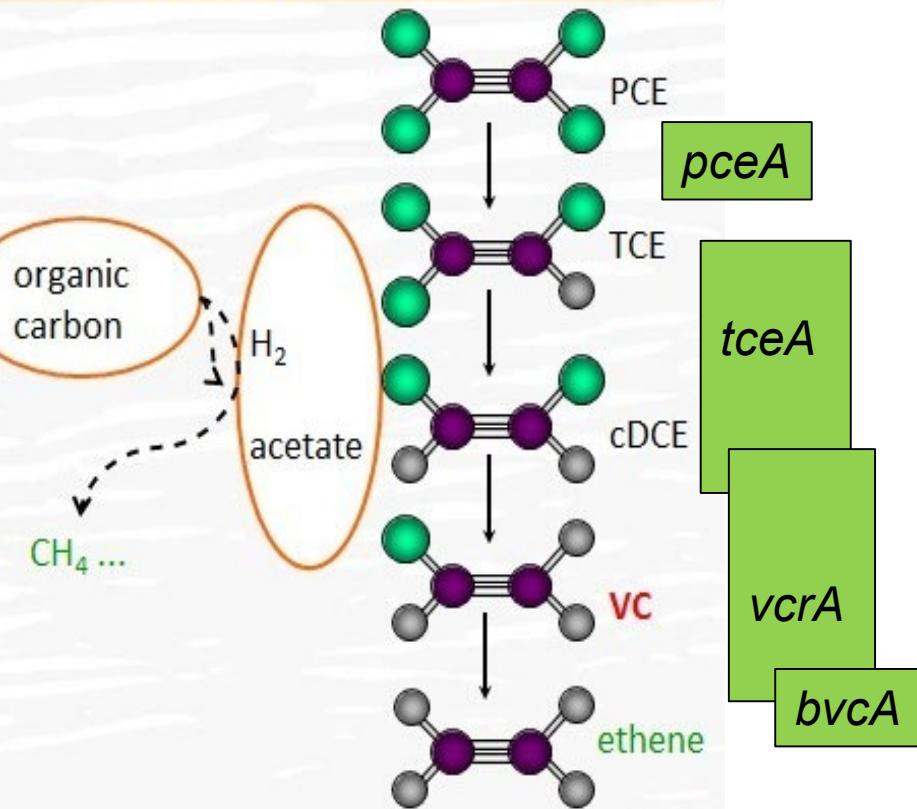

High quantitative accuracy
Rule of thumb: At least 8 -10 data points over the peak

as short as possible

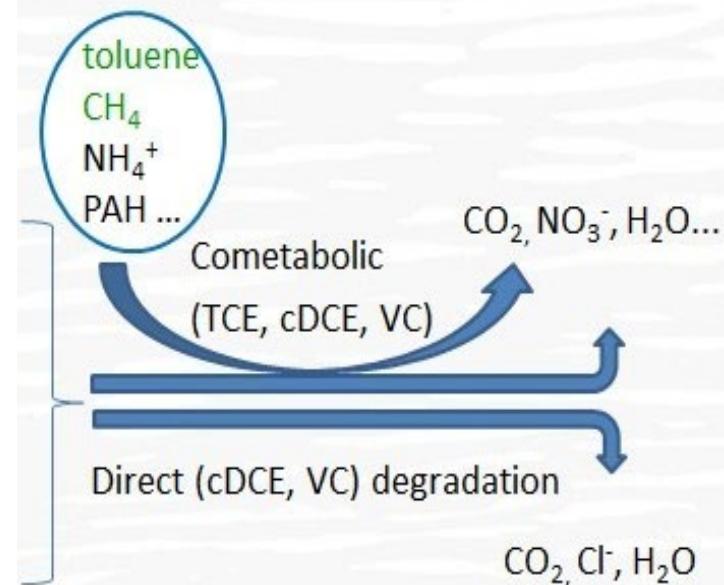

Microbial Dehalogenation of CVOCs

Metagenome

- SDC-9™ metagenome sequenced;
- RDase genes identified and RDase peptides annotated
- Correct* RDase peptides used to identify peptide targets in SDC-9 proteomics
- Approach avoids false negative peptide detection results

*metagenomic guided proteomics reduces probability of misalignment of peptides or using incorrectly annotated sequences from NCBI

Quantitative Analysis

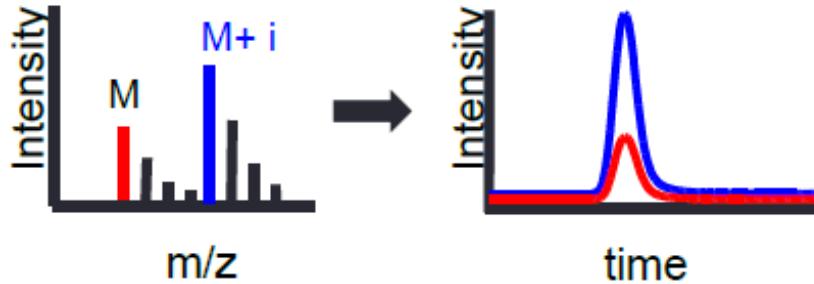

LOD: Limit of Detection

LLOQ: Lower Limit of Quantitation

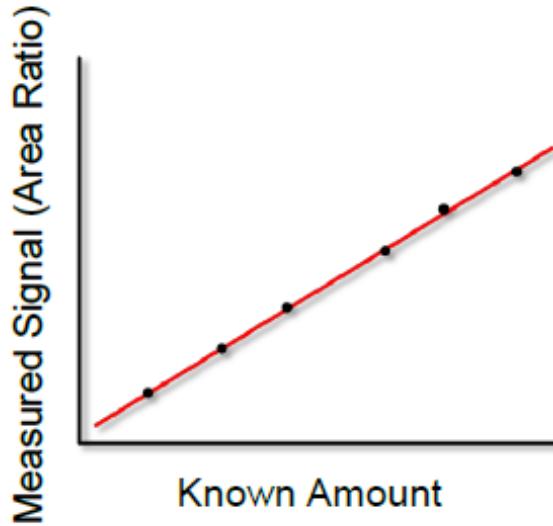

ULOQ: Upper Limit of Quantitation

Source: McCoss Lab, Skyline Workshop
2017, University of Washington

Quantitative Analysis

$$R_0 = \frac{A_0}{A_i} \propto \frac{n_0}{n_i}$$

$$R_0 = k_{0/i} \cdot n_0 + R_i \quad n_0 = \left(\frac{R_0 - R_i}{k_{0/i}} \right)$$

Where: $k_{0/i}$ = is the slope of the standard curve $R_i \approx 0$ Area ratio from a blank ... only internal std

Instrument Detection Limit (IDL) vs Method Detection Limit (MDL)

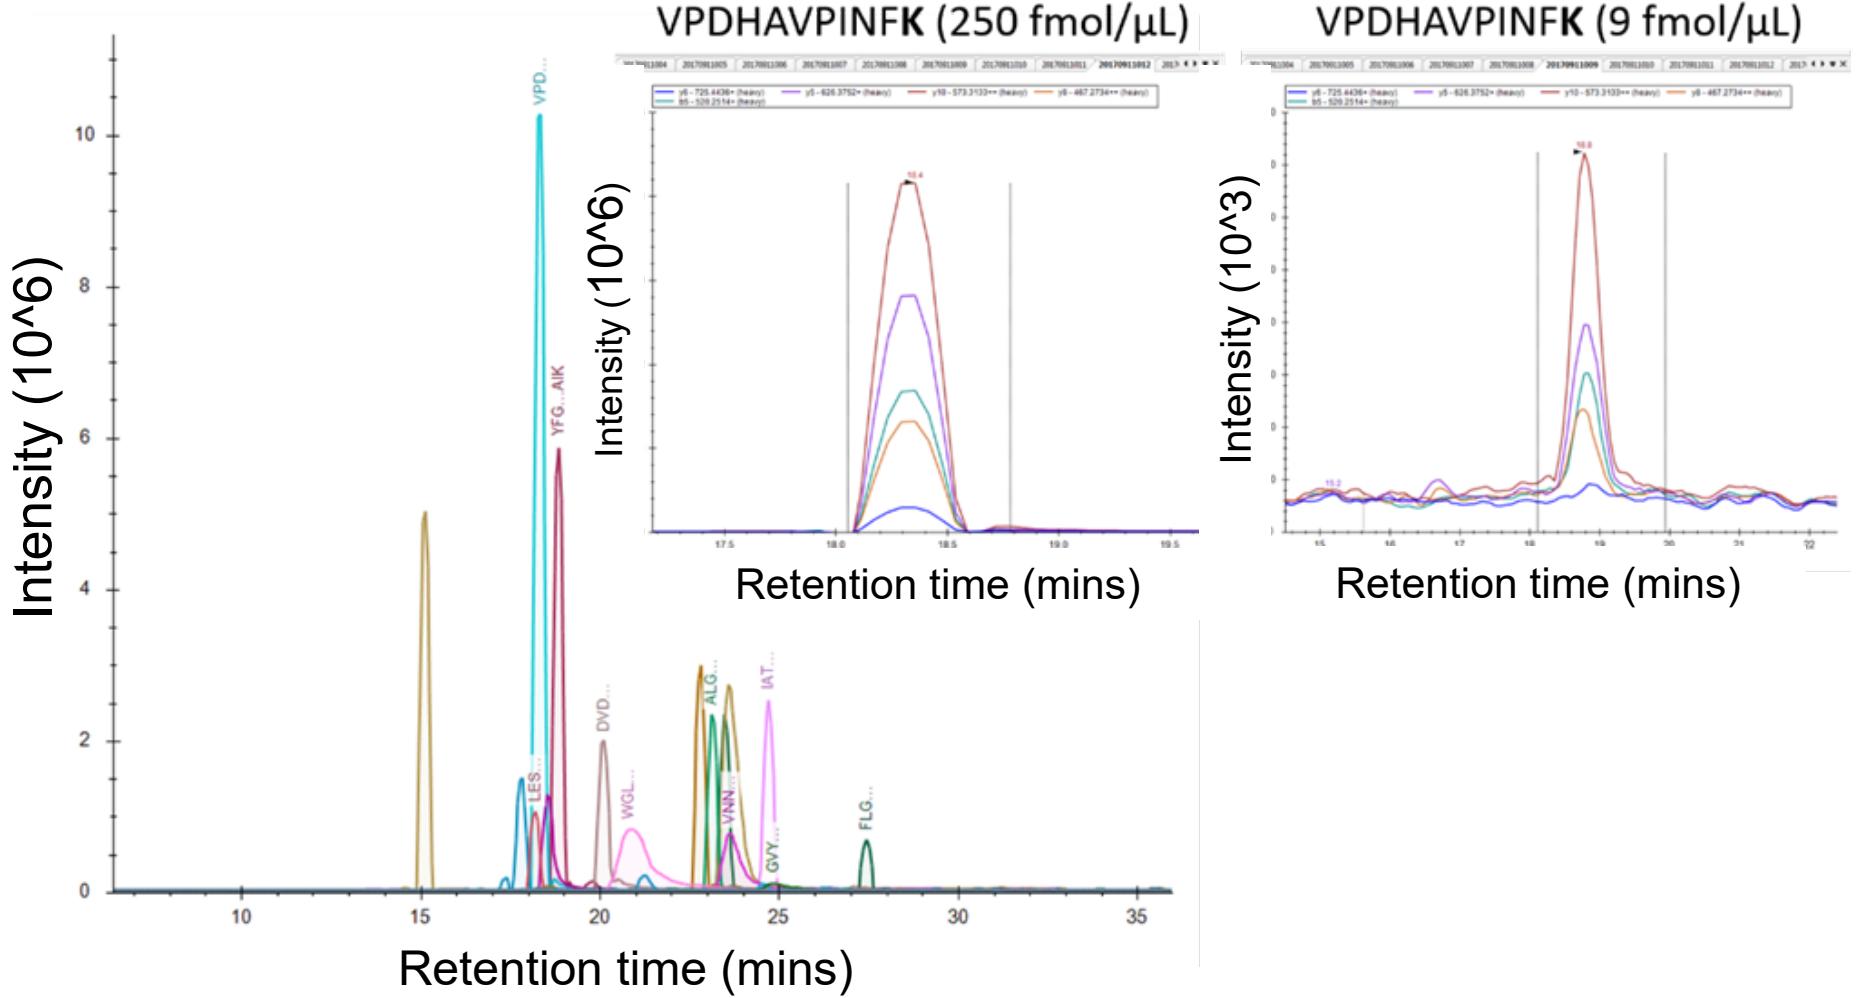

IDL = Instrument Detection Limit

- Peptides injected at a range of concentrations (0.1 fmol/ul to 250 fmol/ul)
- Instrument variability check
- Lower level detection limit established per peptide

MDL = Method Detection Limit

- Peptides injected at a range of concentrations (0.1 fmol/ul to 250 fmol/ul)
- Peptides prepared as experimental samples (extraction, digestion, cleanup)
- Samples run with the optimized SRM method
- Lower level of quantification (LLOQ) and level of detection (LOD) established for each peptide

Method Detection Limit (MDL)

Method Detection Limit (MDL)

Conclusions

- Sequenced SDC-9 genome
- Annotated RDase genes and 32 RDase peptides
- Found 14 conservative RDases – PRM candidates
- Identified all of the isotopically labelled RDases in culture samples
- Quantified RDases in culture samples
