

# Confirming *in situ* Benzene Biodegradation Under Anaerobic Conditions Using Stable Isotope Probing

Kate Clark, Karen Hebbard, and Dora Taggart

Microbial Insights, Inc.

# Overview

Benzene  
Biodegradation

Stable Isotope  
Probing

Analysis of 300+  
SIP Samples

Results by  
Treatment

# Anaerobic Benzene Biodegradation

# Anaerobic Benzene Degradation

- Anaerobic conditions common, particularly in source area
- Reported under all terminal electron accepting processes
- Degraders likely not ubiquitous
- May be slow with long lag times and/or inhibited by co-contaminants
- A determining factor in the success or failure of MNA

# Limited qPCR Assays Available

# Stable Isotope Probing

# Stable Isotope Probing

- Specially produced “heavy” compounds which are composed of 99+%  $^{13}\text{C}$ 
  - Natural Compounds are 99%  $^{12}\text{C}$
  - Same characteristics as original compound
  - Behave similar to the natural compound
- Used as “tracers” to increase our understanding of contaminant fate
  - BTEX, fuel oxygenates, naphthalene, chlorobenzene, 1,4-dioxane

# Stable Isotope Probing

# Bio-Trap SIP Analysis

Residual  $^{13}\text{C}$ -Compound

Utilization

$^{13}\text{C}/^{12}\text{C}$  Dissolved Inorganic Carbon

Mineralization  
(C for energy)

$^{13}\text{C}/^{12}\text{C}$  of Biomarkers

PLFA  
DNA  
RNA

Metabolism  
(C for growth)

# Unit of Measure

Amount of  $^{13}\text{C}$  relative to  $^{12}\text{C}$  is expressed by the  $\delta^{13}\text{C}$  notation

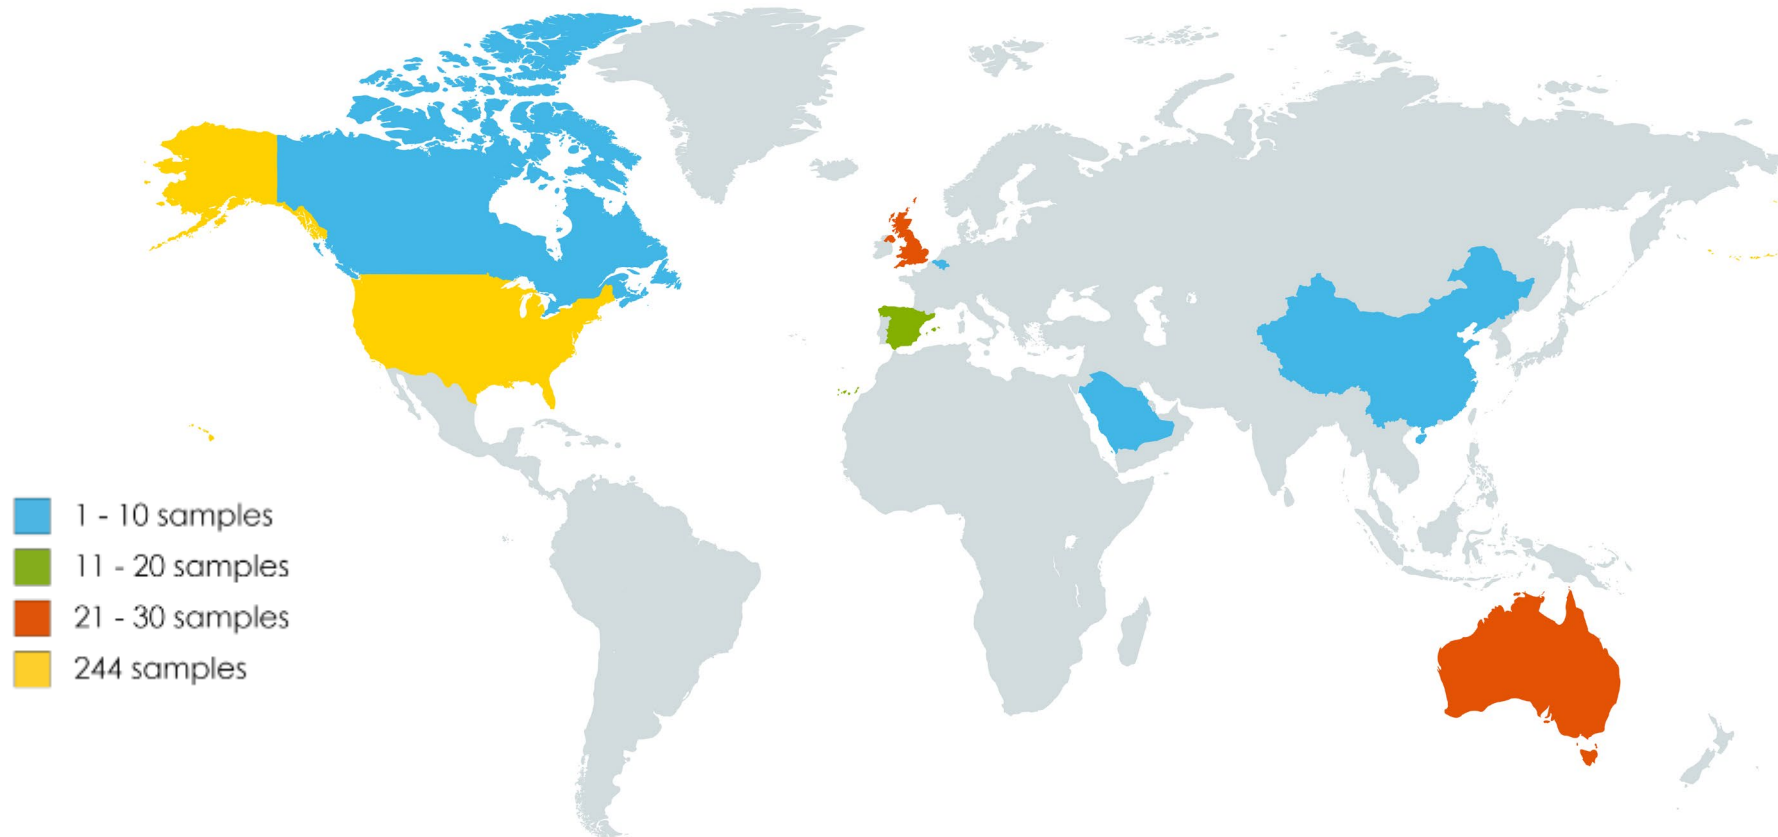

$$\delta^{13}\text{C} [\text{‰}] = \left( \frac{(^{13}\text{C}/^{12}\text{C})_{\text{Sample}}}{(^{13}\text{C}/^{12}\text{C})_{\text{Standard}}} - 1 \right) \cdot 1000$$

The standard is a specific carbon-containing mineral from a specific location: Pee Dee Belemnite (PDB)

Units of  $\delta^{13}\text{C}$  are ‰ or “per mill”

# SIP Benzene Dataset

309 samples from 90 different sites

# SIP Benzene Dataset

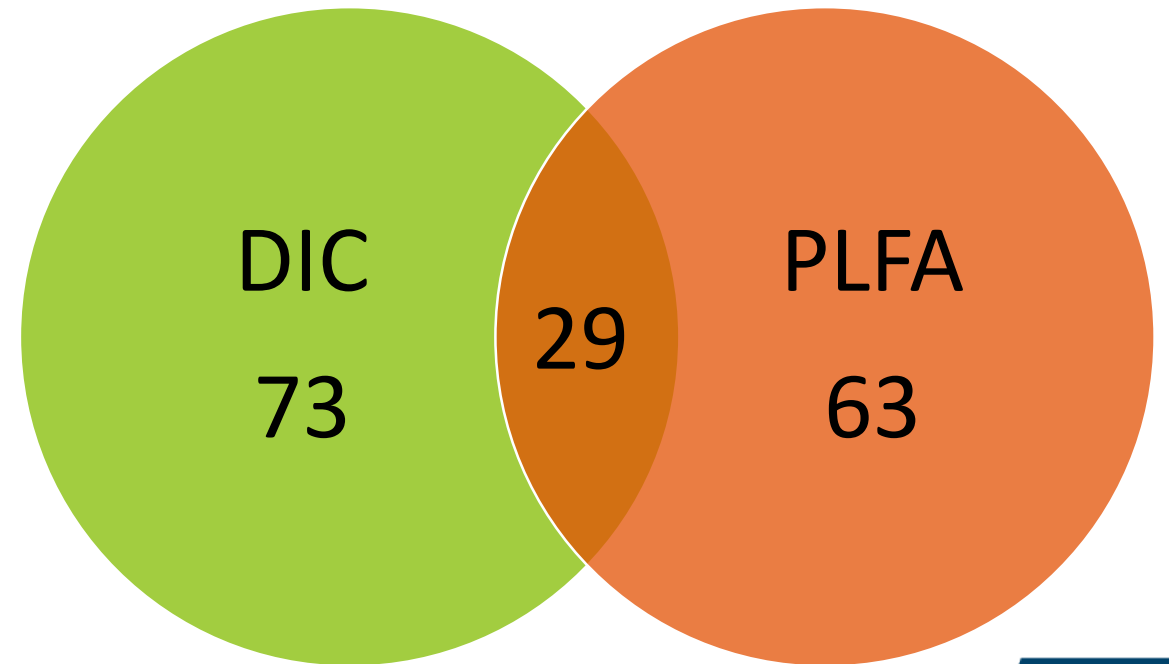

Benzene Biodegradation

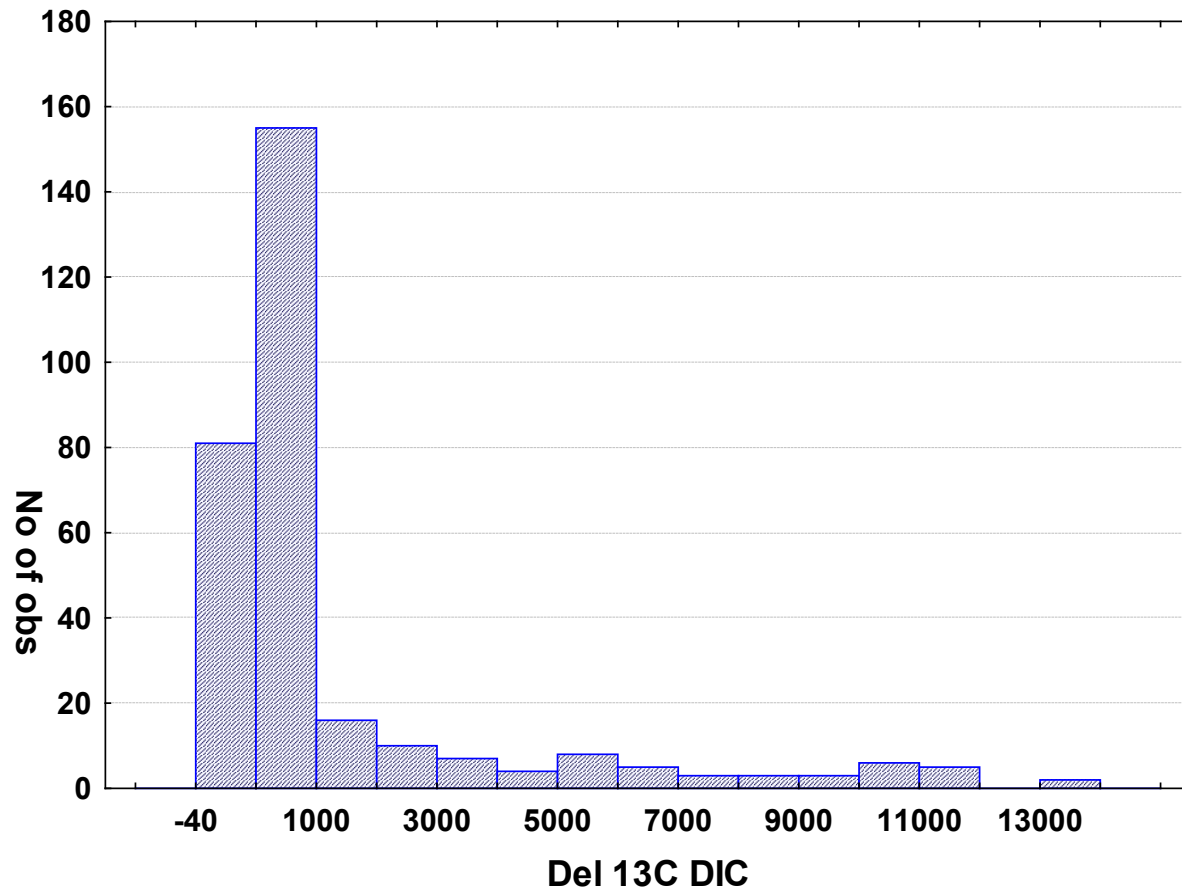

Yes  
92%

No  
8%

Samples with high  $^{13}\text{C}$  enrichment  
( $\delta^{13}\text{C} > 1,000\text{‰}$ )

# $^{13}\text{C}$ -Enriched DIC

$\delta^{13}\text{C}$  Values (‰)

< 0   0 - 99   100 - 999   1,000+

# $^{13}\text{C}$ -Enriched PLFA

$\delta^{13}\text{C}$  Values (‰)

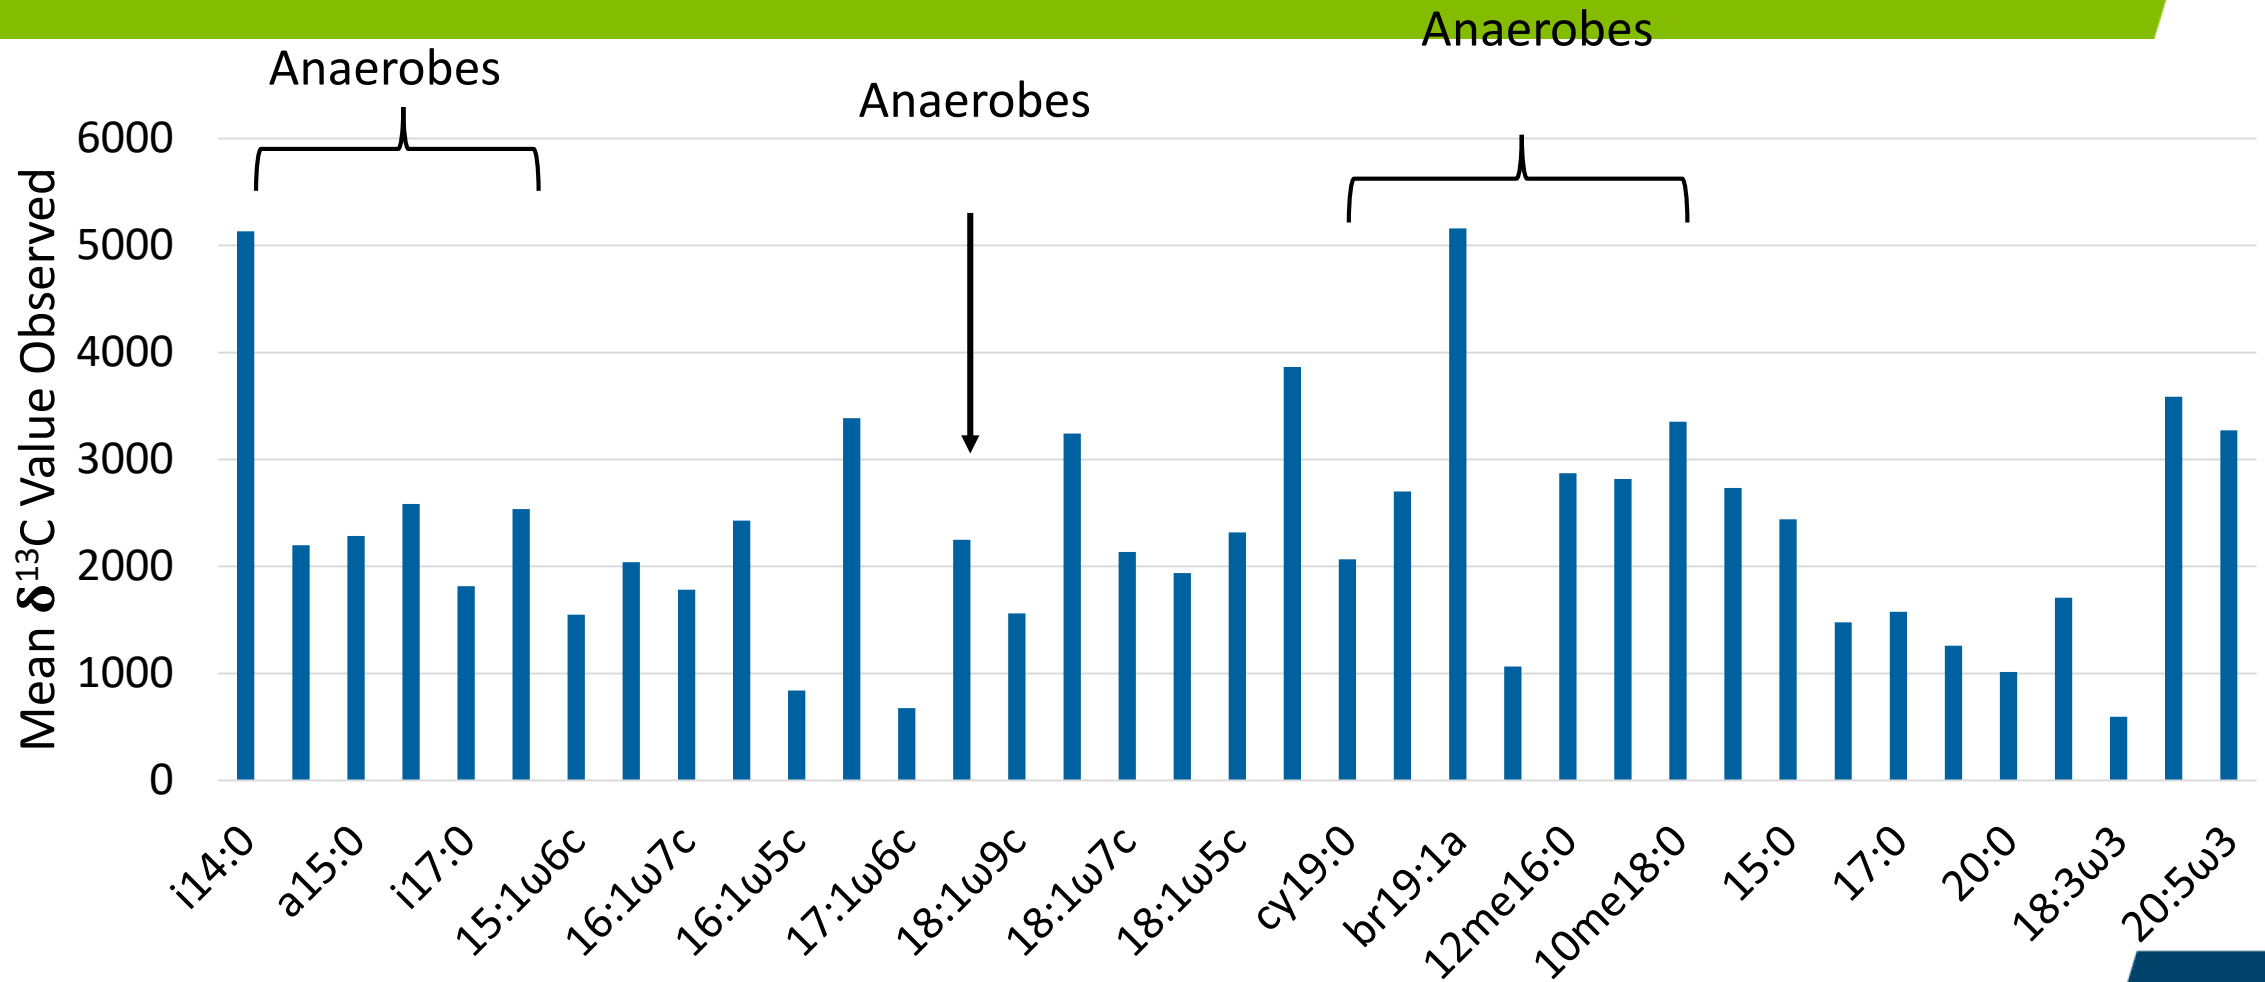

■ < 0 ■ 0 - 99 ■ 100 - 999 ■ 1,000+

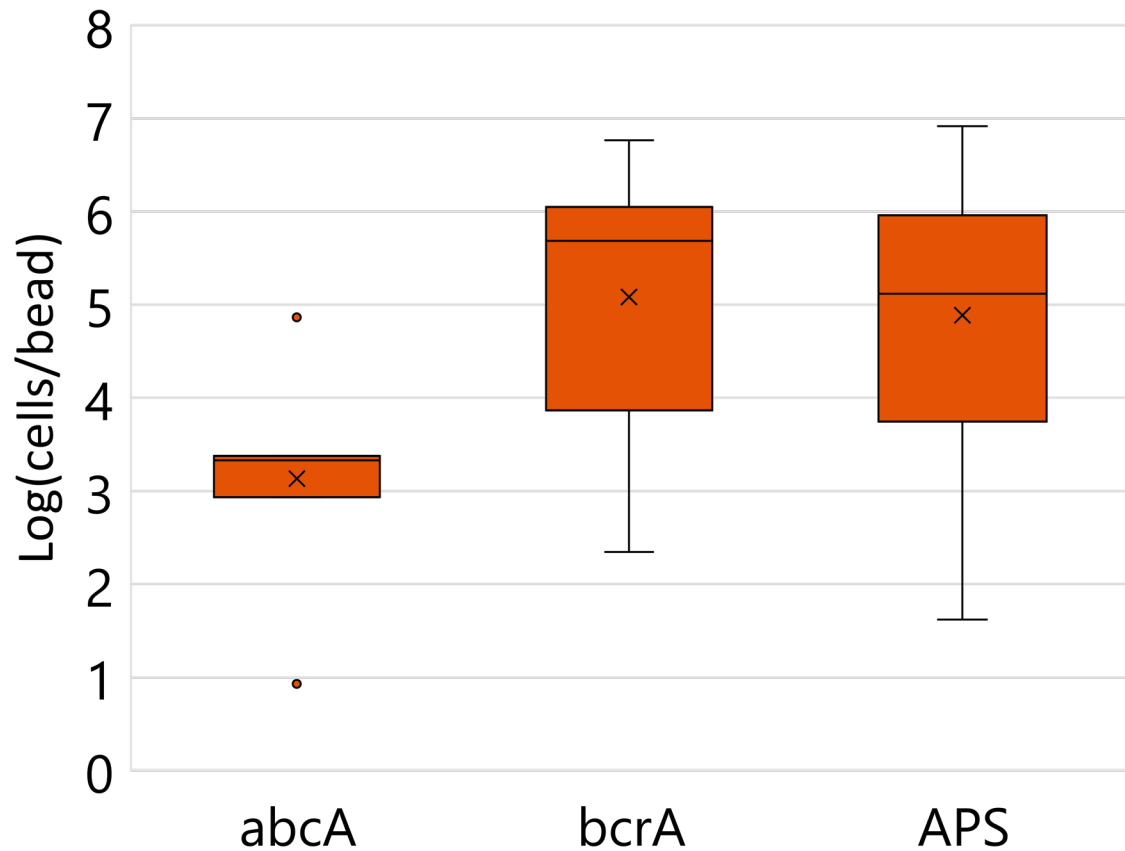

55% (169 of 309) had at least one  $^{13}\text{C}$ -enriched anaerobic indicator

- Anaerobic Proteobacteria (cy17:0 and cy19:0)
- Firmicutes (Terminally Branched Saturated)
- Anaerobic Metal Reducers (Branched Monoenoic)
- Sulfate Reducers/Actinomycetes (Mid-Chain Branched Saturated)

# $^{13}\text{C}$ -Enriched Fatty Acids

# Subset with qPCR Analysis

Gene		Detection Frequency
Benzene carboxylase	abcA	11% (7 of 66)
Benzoyl coenzyme A reductase	bcrA	79% (34 of 43)
Sulfate reducers	APS	88% (64 of 73)

GEO

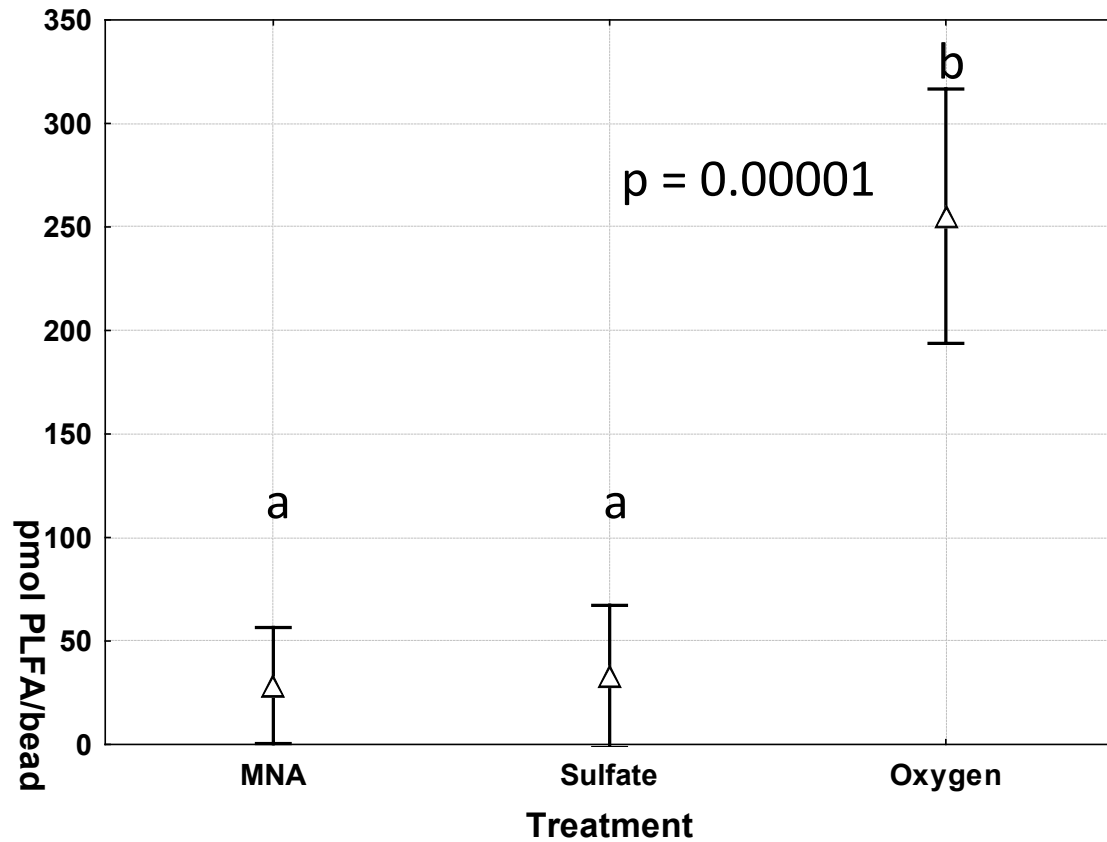

Oxygen or  
Sulfate

# DIC $\delta^{13}\text{C}$ by Treatment

# Total and $^{13}\text{C}$ -Enriched PLFA

# Aerobic Proteobacteria Marker - 16:1 $\omega$ 7c

# Anaerobic Proteobacteria Marker - cy19:0

# Sulfate-Reducer Marker - 10me16:0

# Conclusions

- Confirmed benzene degradation in 92% of samples
- $^{13}\text{C}$ -enriched fatty acids indicative of anaerobes in 55% of samples
- Benzene carboxylase gene less frequently detected
- Analysis of samples with known treatment suggested oxygen addition increased overall biomass and stimulated both aerobic and anaerobic degradation of benzene and its metabolites

Thank you for your time
