The business of sustainability

Fourth International Symposium on Bioremediation and Sustainable Environmental Technologies May 2017

Agenda

- Introduction to Toxic Substances Control Act (TSCA) and Chemical Safety Act (CSA)
- Characterizing Risk
- Implications for Site Remediation

Origins of TSCA

President's Council on Environmental Quality, April 1971:

"We should no longer be limited to repairing damage after it has been done; nor should we continue to allow the entire population or the entire environment to be used as a laboratory"

TSCA: not just for PCBs

Law allowed EPA to:

- Evaluate the risk from exposure to new chemicals and regulate if necessary to limit risk
- Require manufacturers to test chemicals for toxicity in some cases
- Regulate the use of existing chemicals

EPA could not require testing unless substance presents an unreasonable risk:

- ~62,000 chemicals grandfathered
- Approximately 10% of the chemicals brought to market since 1976 regulated

Frank R. Lautenberg Chemical Safety for 21st (aka TSCA reform)

Mandatory requirement for EPA to evaluate existing chemicals with clear and enforceable deadlines Signed into law June 2016

Requires risk assessment of prioritized existing chemicals

Is supposed to provide a consistent source of funding for EPA to carry out responsibilities

The business of sustainability

Chemical Characterization: 1976 TSCA – 2016 CSA

The business of sustainability

CSA Changes Risk Assessment Paradigm

EPA's New Look at Old Chemicals under the CSA: the Work Plan Process

PBT = Persistent, Bioaccumulative, Toxic

The business of sustainability

7

Timeline for CSA EPA Risk Assessments

Implications for Site Cleanup

Implications for Site Investigation and Cleanup

We find what we look for

Under 1976 TSCA, little to no data on fate and transport, toxicity or eco toxicity of most chemicals

The business of sustainability

Top Ten TSCA Work Plan Chemicals

Est. Annual US Production (lb/yr)

Number of Superfund Sites Affected?

No published records, or not analyzed:

- Bromopropane
- Cyclic Aliphatic
 Bromide Cluster
- N-methylpyrrolidone
- Pigment Violet 29

What about the next 80?

What about those 24?

1,2-DCA and VC produced >10 Billions lbs/yr

New Cleanup Goals?

Under the CSA, EPA

- Emphasizes certain endpoints: PBT, reproductive/developmental toxicity, neurotoxicity, respiratory sensitization
- Considers new sources of data, (i.e. European Union regulation REACH)

New focus and data sources could mean changes in dose response considerations that affect clean-up levels.

15

IRIS Status of First 10 **Chemicals**

Not in IRIS

- IRIS entry > 10 yrs old
- IRIS entry < 10 yrs old

1,4-Dioxane Toxicity Evaluation

(MOA) for 1,4-dioxane : Obtained information on

Regulatory Toxicology and Pharmacology

- Japanese cancer bioassay (mouse liver histopathology)
- Concluded information supported a non-linear (threshold) MOA

Alliance for

Risk Assessment

- **Risk-based groundwater** standard ~350 ug/L
- TSCA must use best available science in risk assessment documents

Takeaways

Chemical Safety Act (CSA) may impact:

- New contaminants of concern
- New cleanup goals
- Potential lack of predictability about ARARs
- Impact at five-year review

Extent depends upon:

- Potential for release of target compounds into environment, past or future
- Potential for new or changed Agency assessment of hazard
 - Date of last IRIS update and potential for new data or endpoints

Wild cards:

=f(x)

- So far, CSA implementation untouched by Administration's regulatory roll-back and cost-cutting but stay tuned
- Potential for IRIS defunding

How do we manage this?

We have the tools to

- Anticipate potential outcomes
- Contribute to the scientific discussion
- Make informed technical and business decisions
