

Enhancing Biodegradation of LNAPL with Bioventing

Steven Gaito

Bioventing

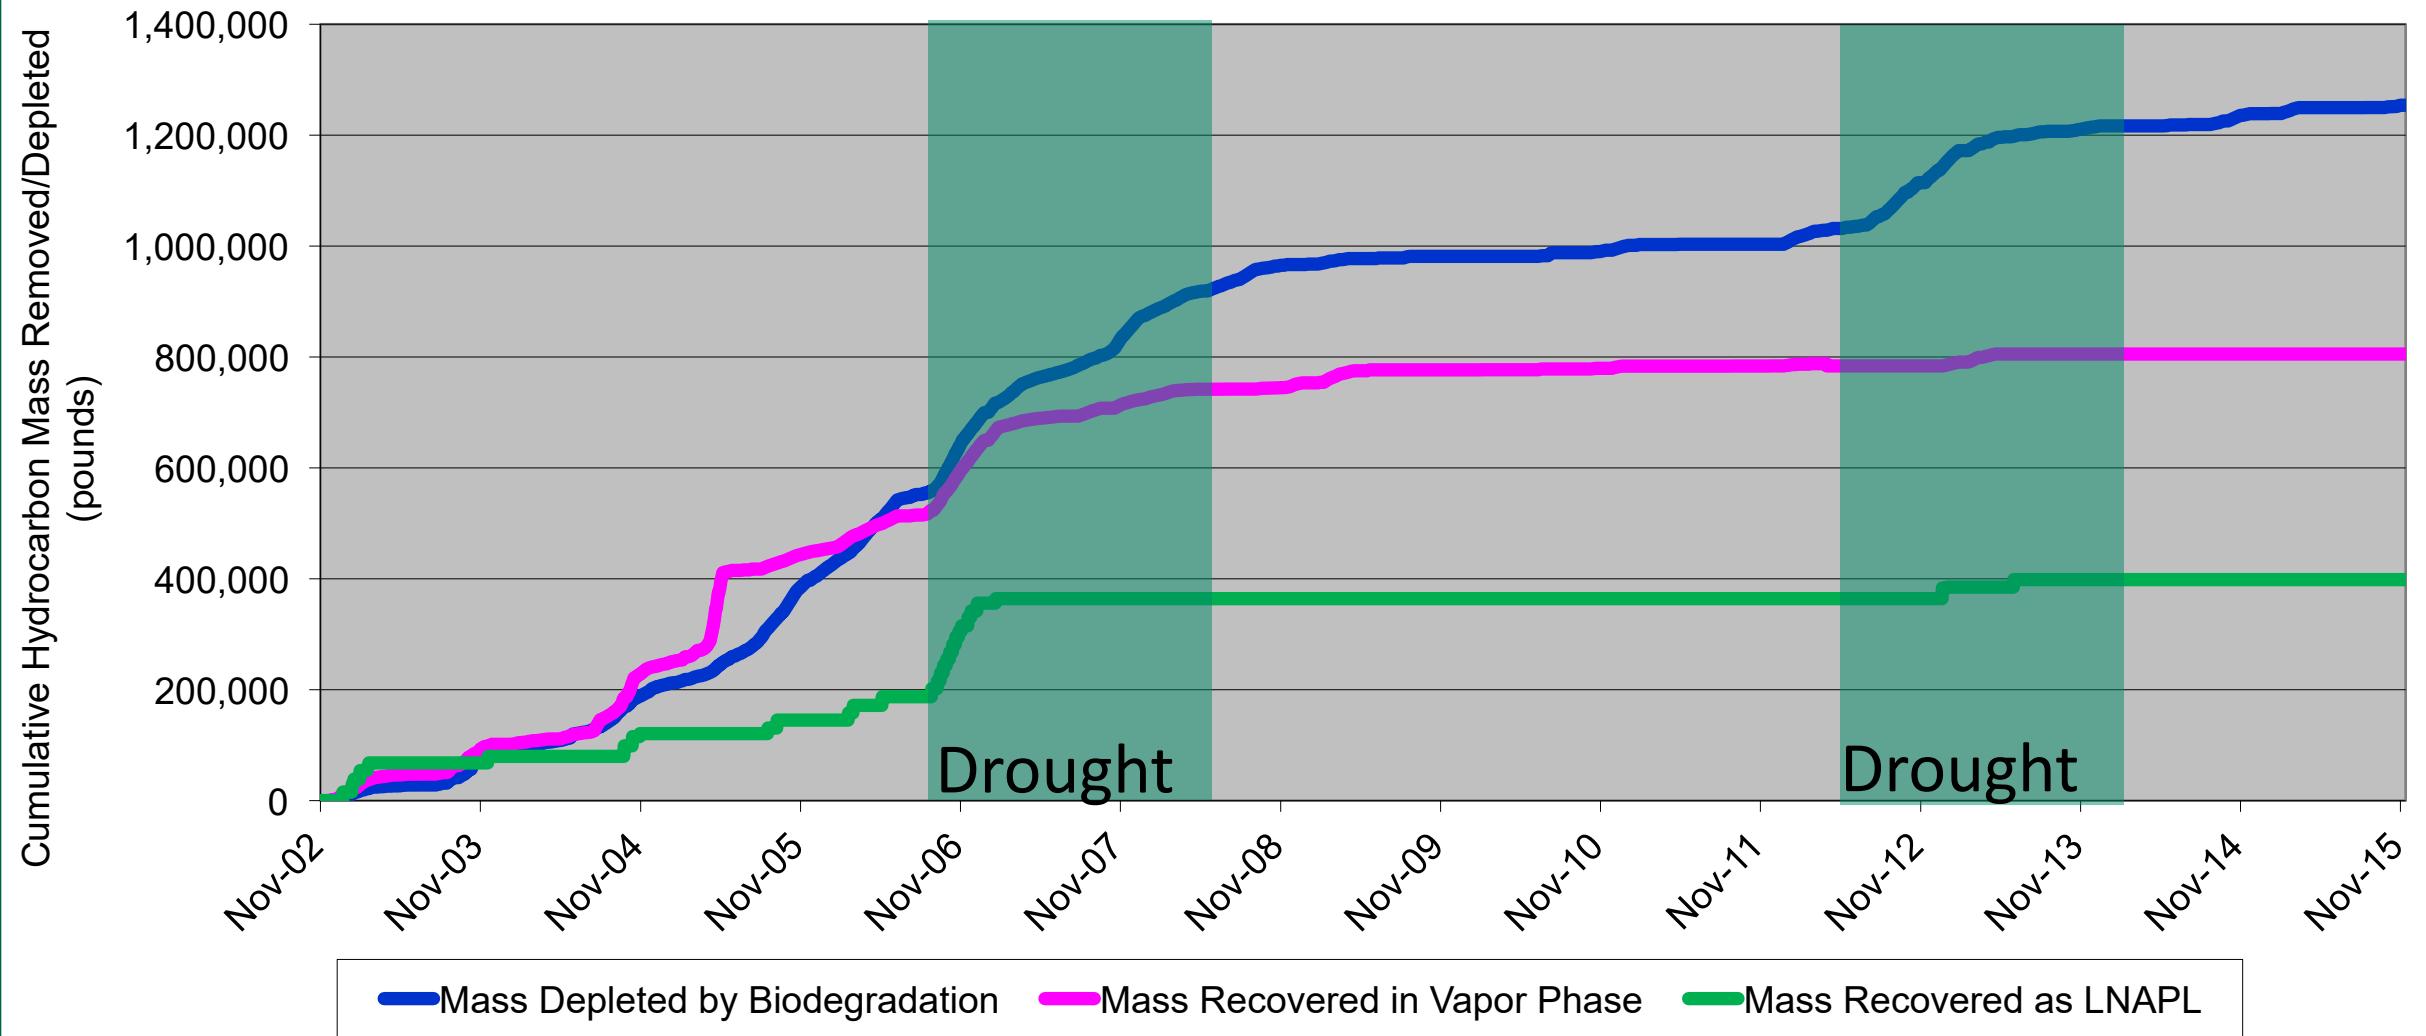

Traditionally considered a remedy for aerobically degradable contaminants in the vadose zone

Not considered applicable at sites with mobile LNAPL

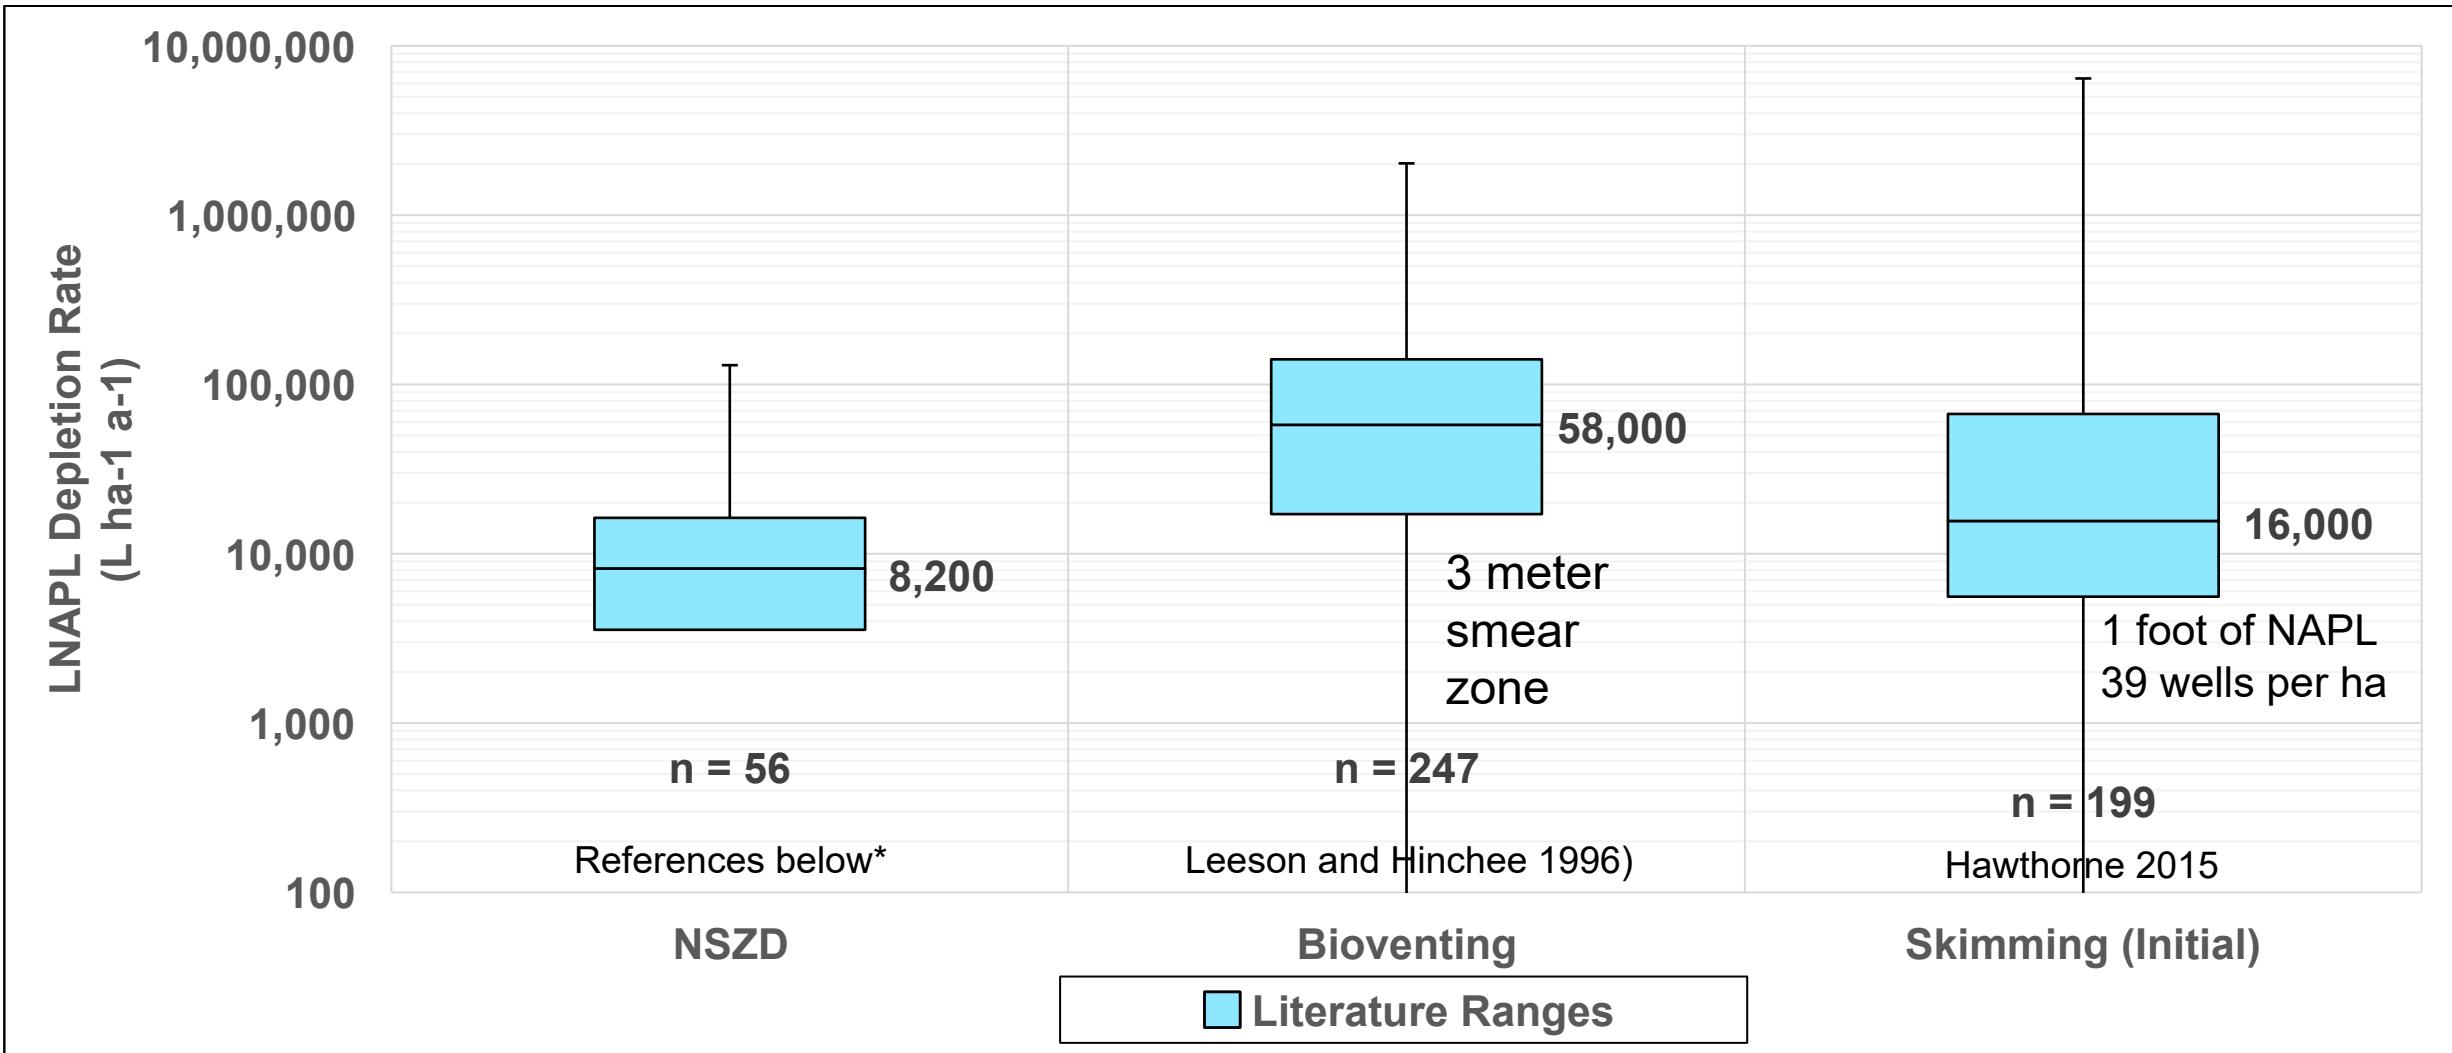

Bioventing for Mobile LNAPL?

Multiphase Extraction (MPE) Semi-confined Gasoline Plume

Biodegradation was most effective

LNAPL Depletion Rates

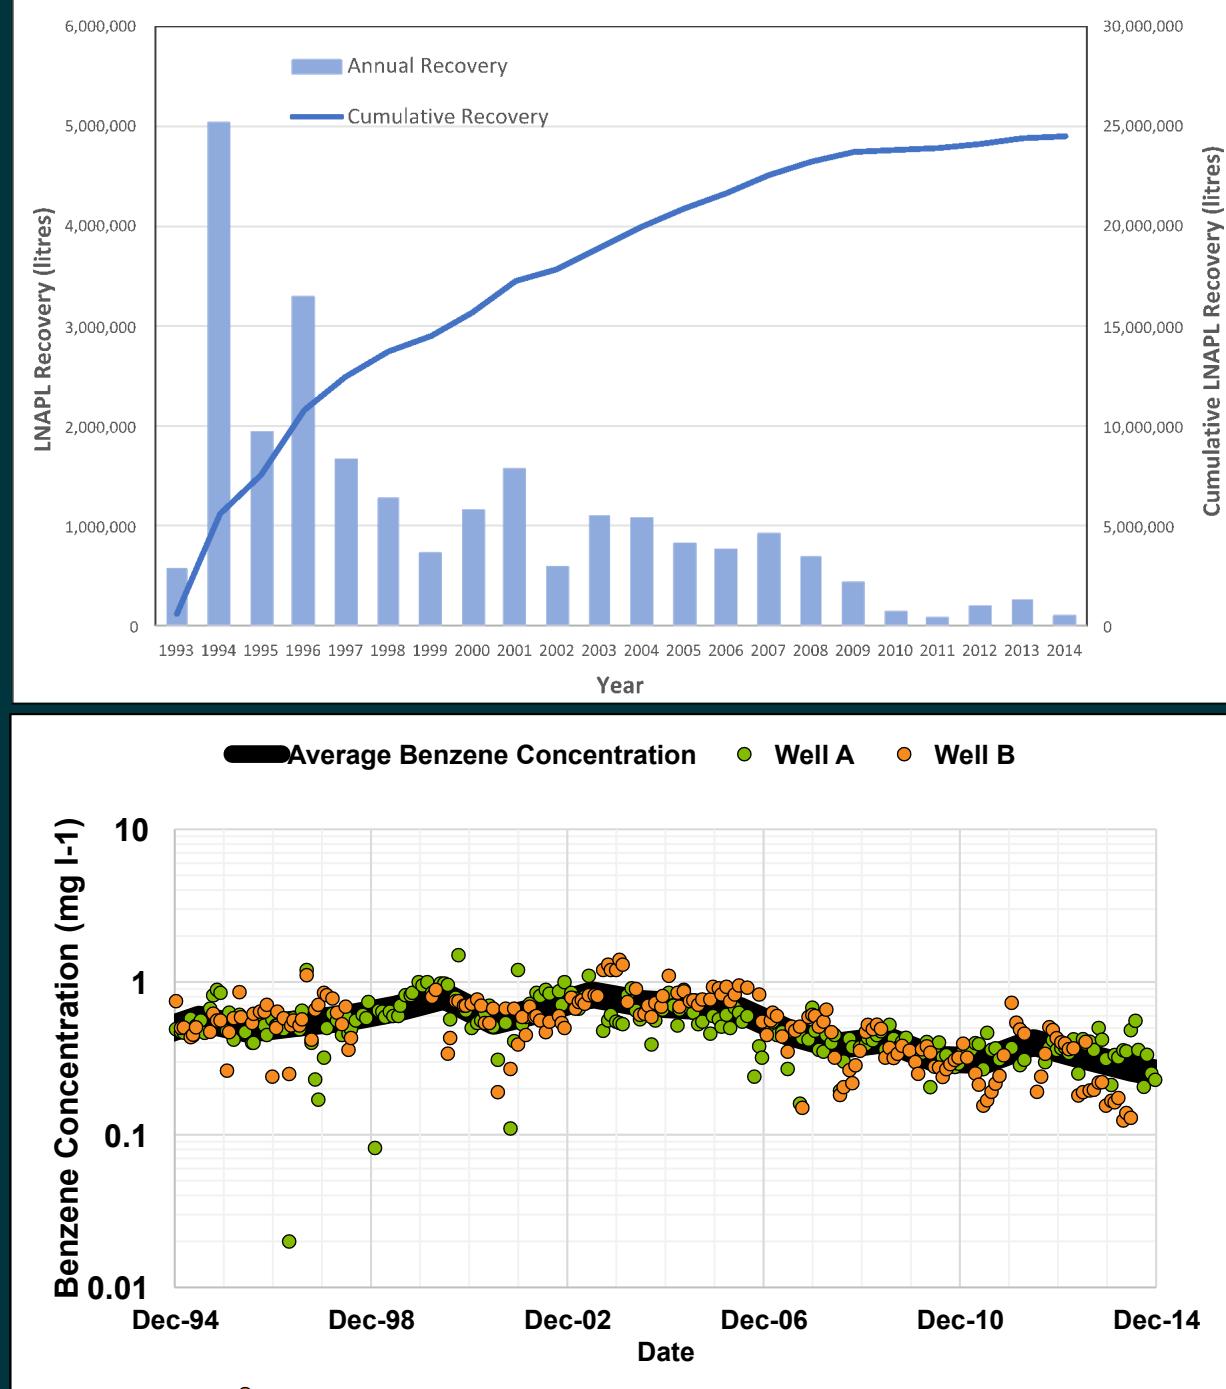

Bioventing Forum

- Engage stakeholders on maximum extent practicable (MEP)
- Hydraulic recovery vs. bioventing vs. natural source zone depletion (NSZD)
- Series of meetings
 - AECOM
 - API Members
 - EPA HQ and Regions
 - ~15 States
- Journal article
 - Not explicitly endorsed by forum

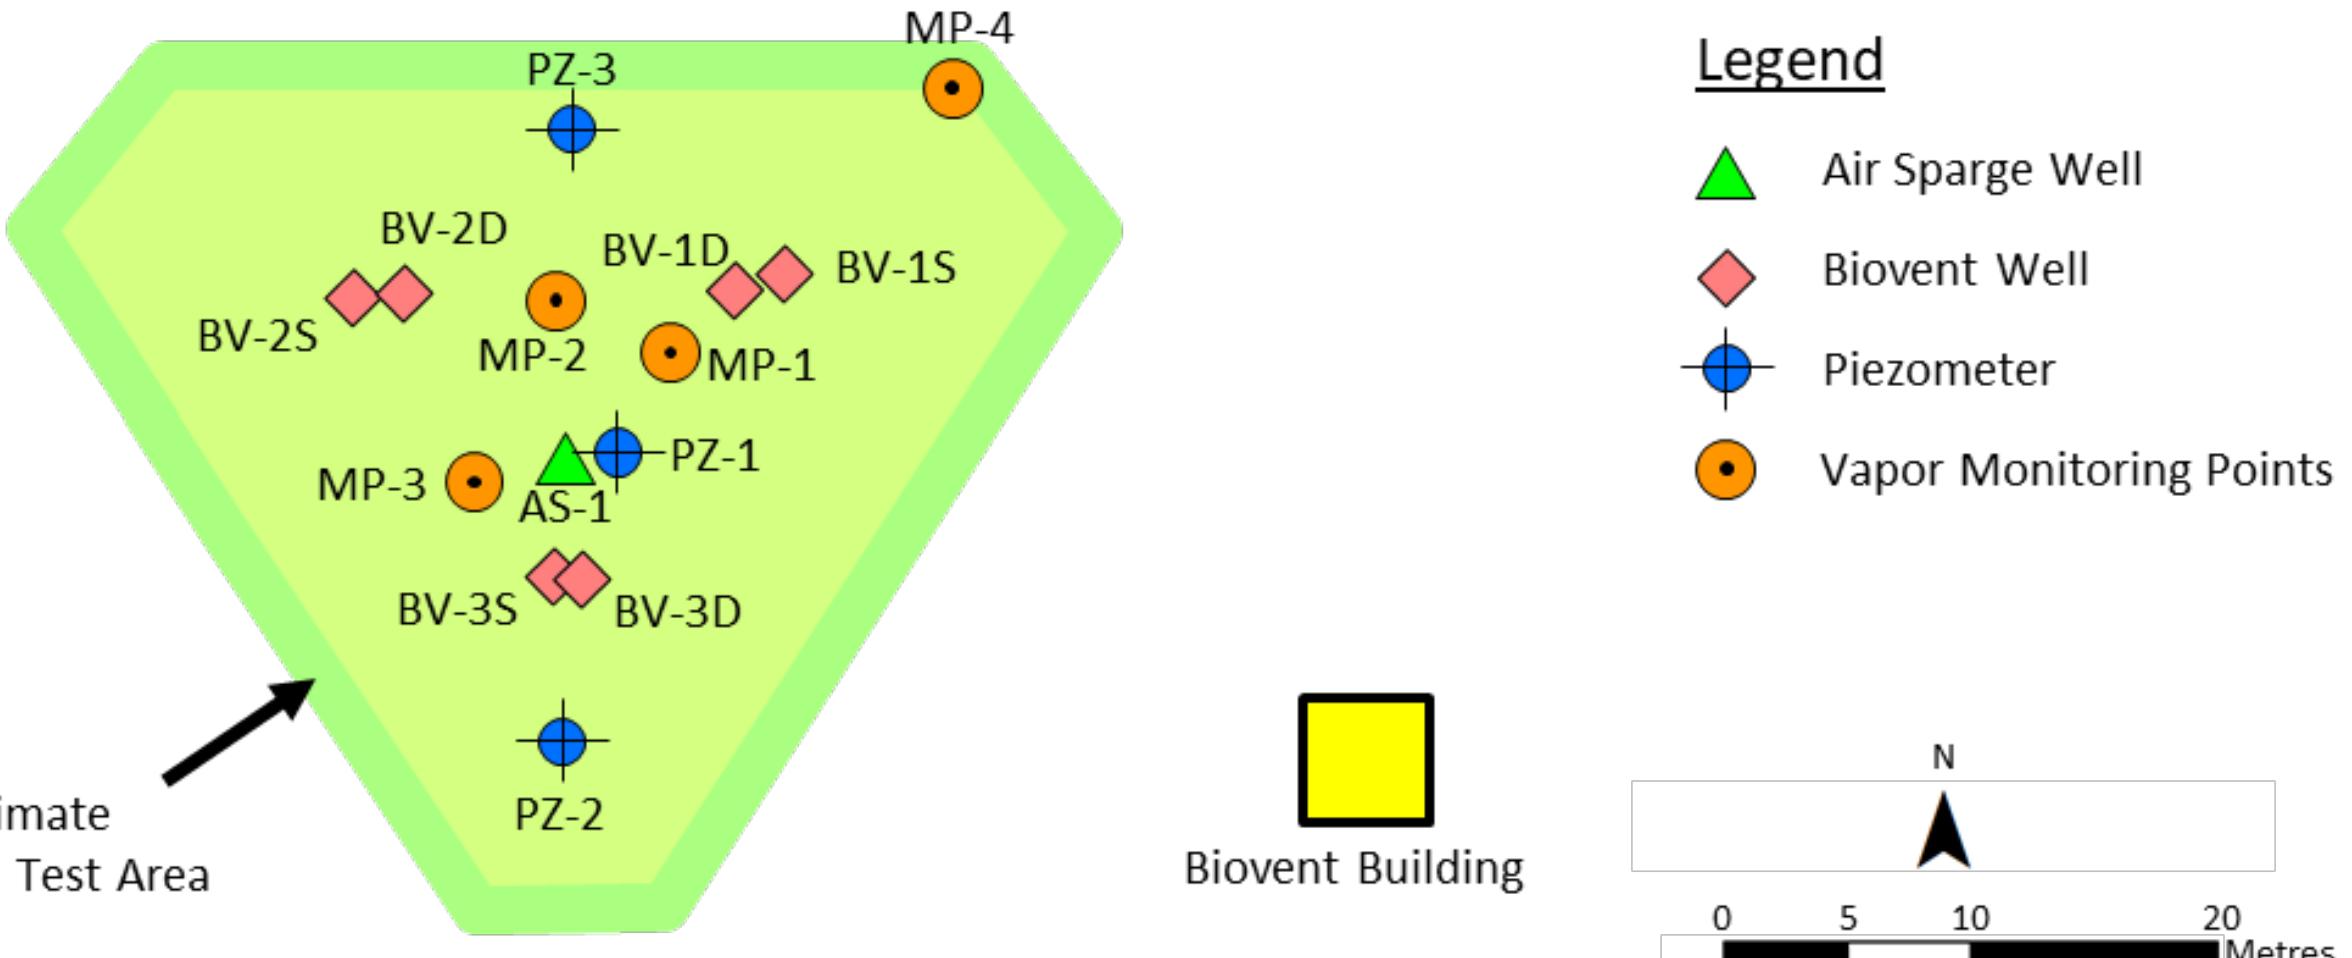

Case Study

- Site Conditions
 - Fine grained soils overlying sand
 - Water ~10 meters below ground
 - LNAPL smear zone
 - 3-6 meters above water table
 - 10 meters below water table
- Historical Remedial Actions
 - LNAPL recovery
 - Groundwater pumping
- Remedial Goals
 - Recover LNAPL to Maximum Extent Practicable
 - Reduce benzene concentrations
- Challenges
 - Asymptotic hydraulic LNAPL Recovery
 - Elevated benzene concentrations

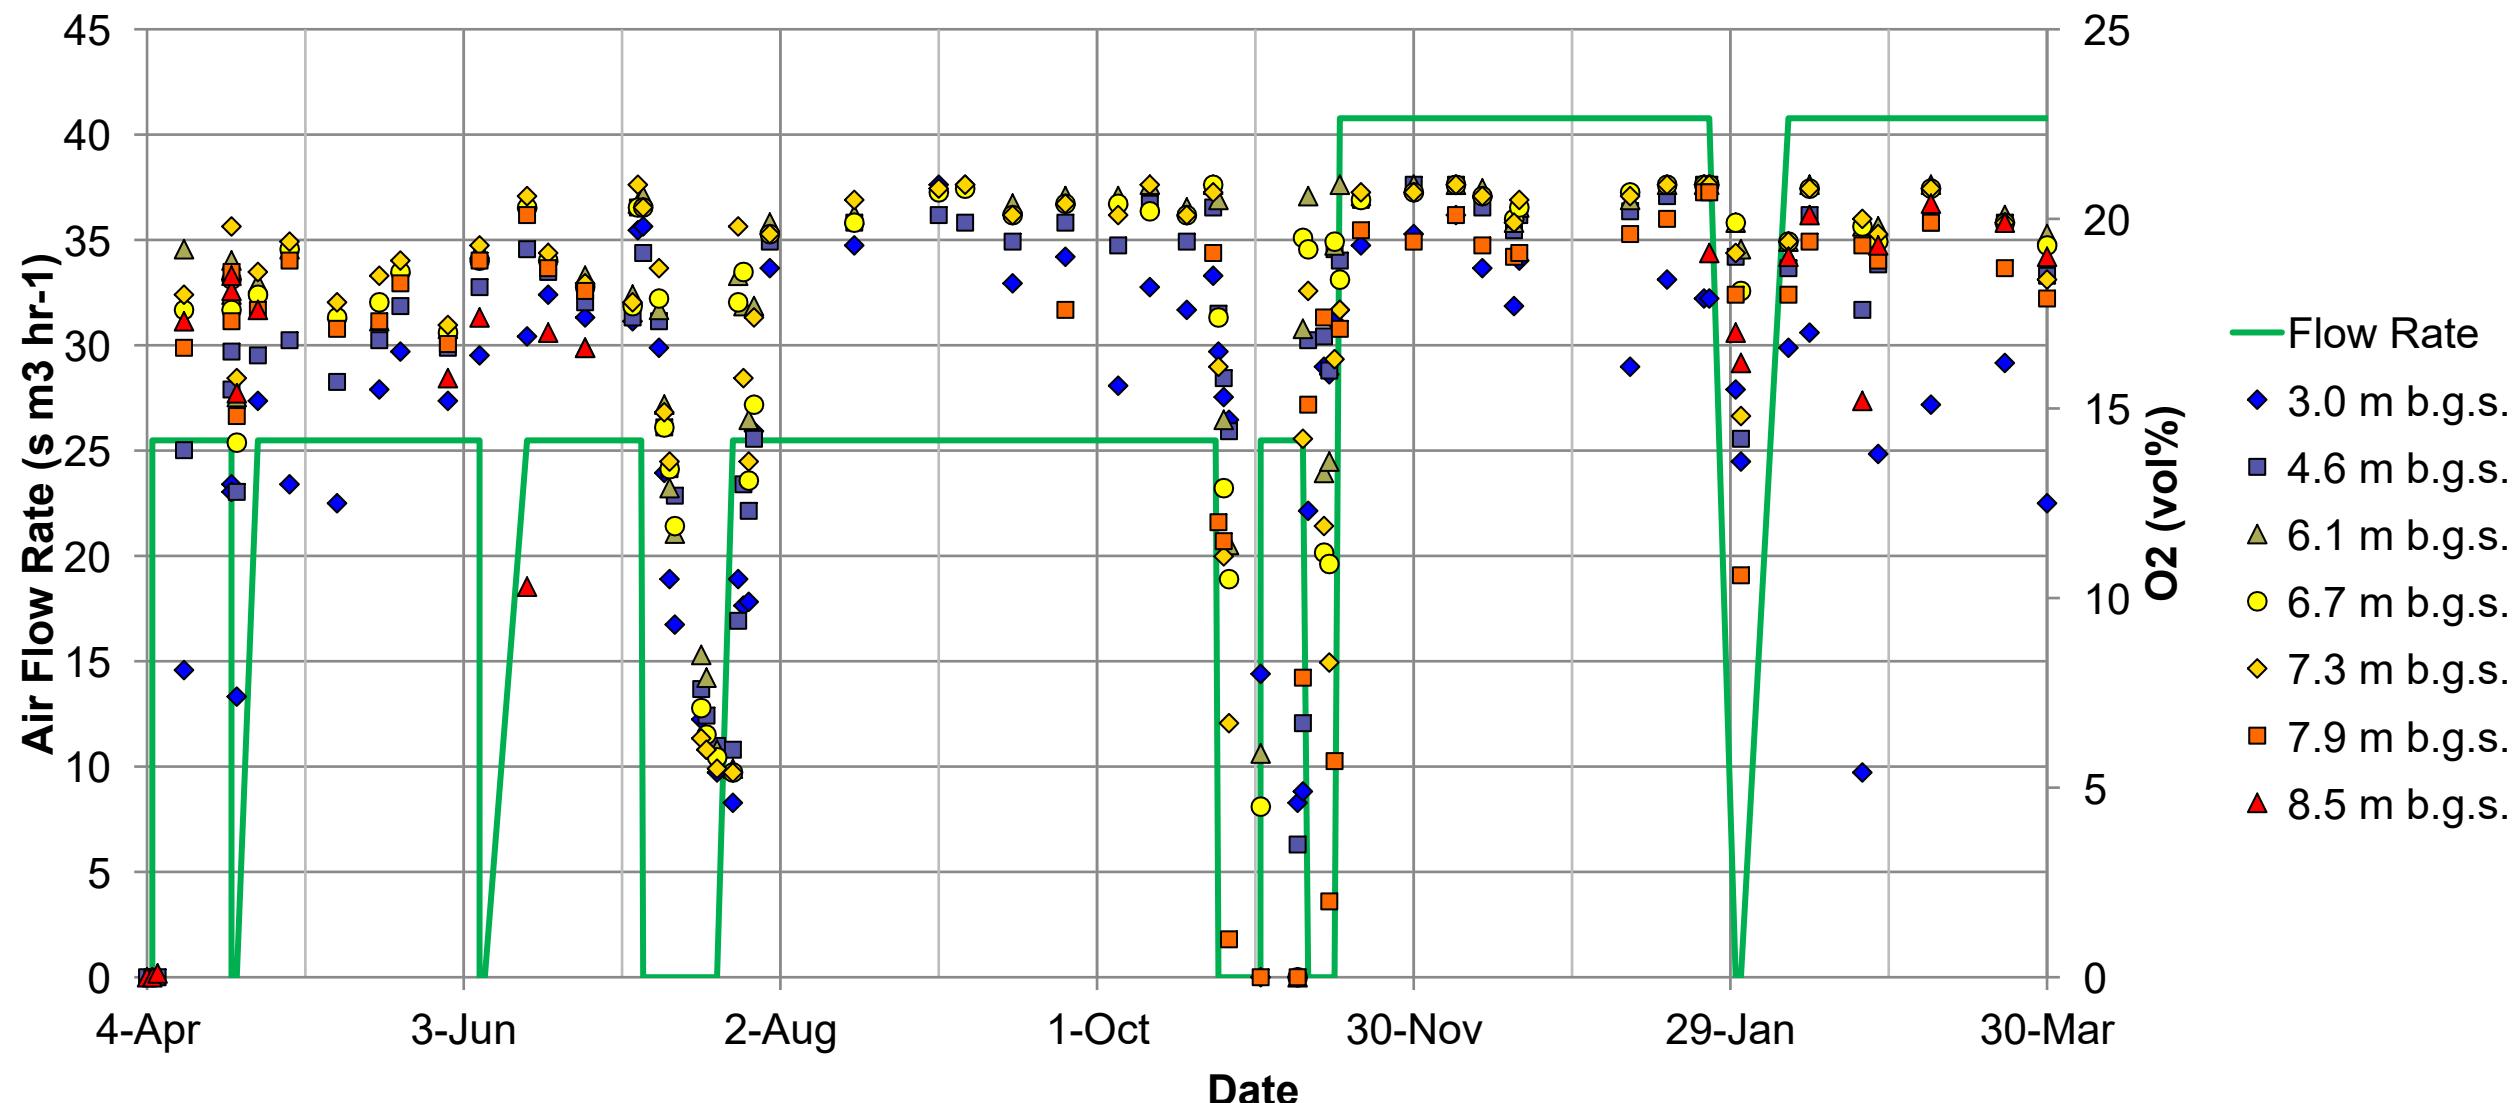

Pilot Study

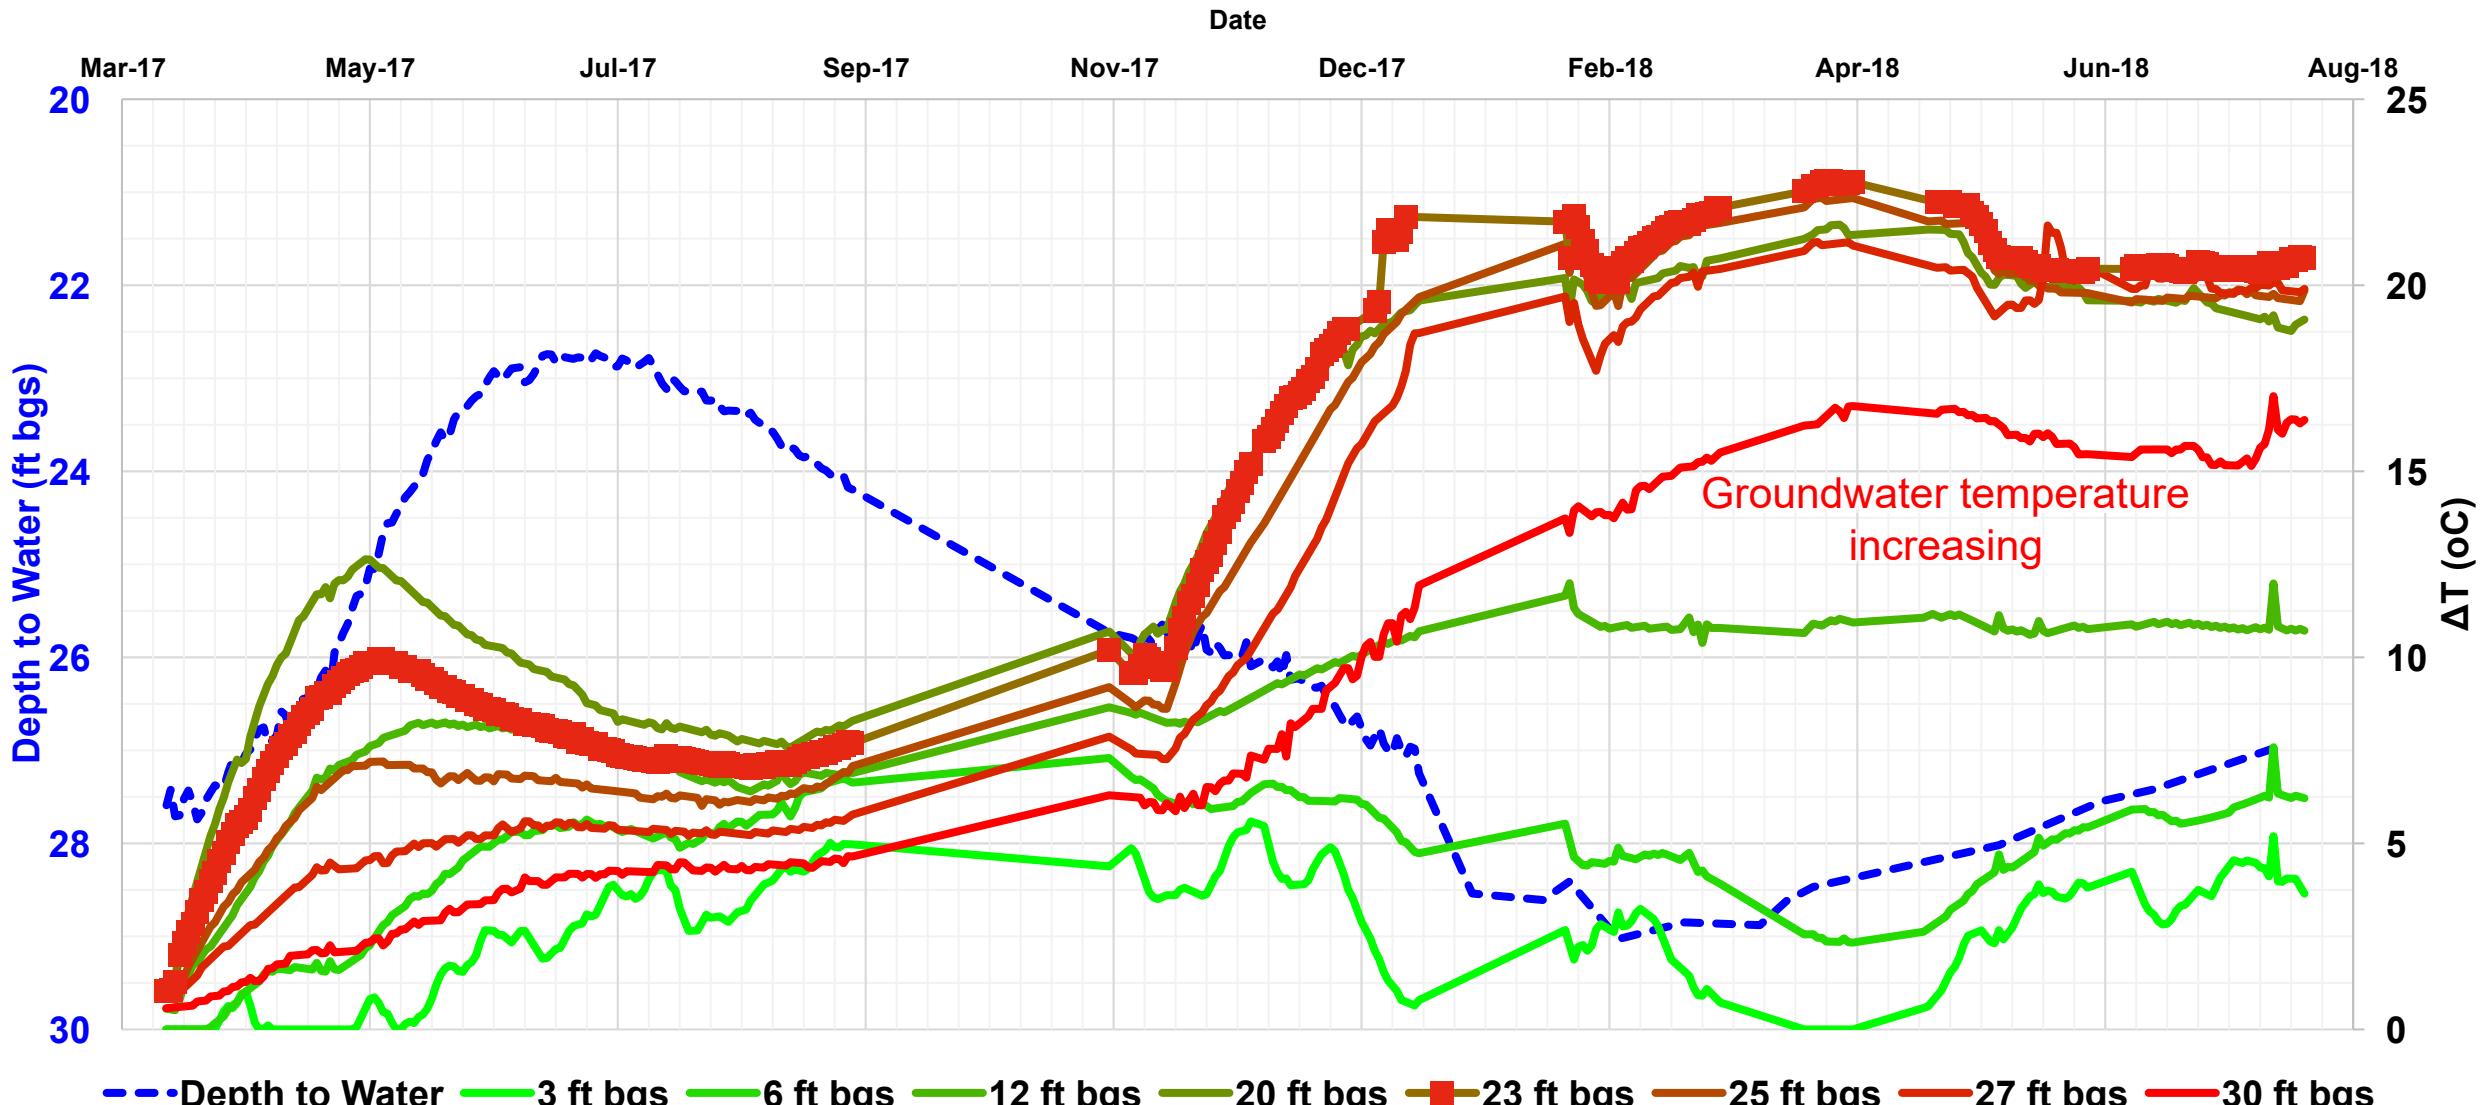

Bioventing to Enhance Biodegradation

Evidence of Biodegradation

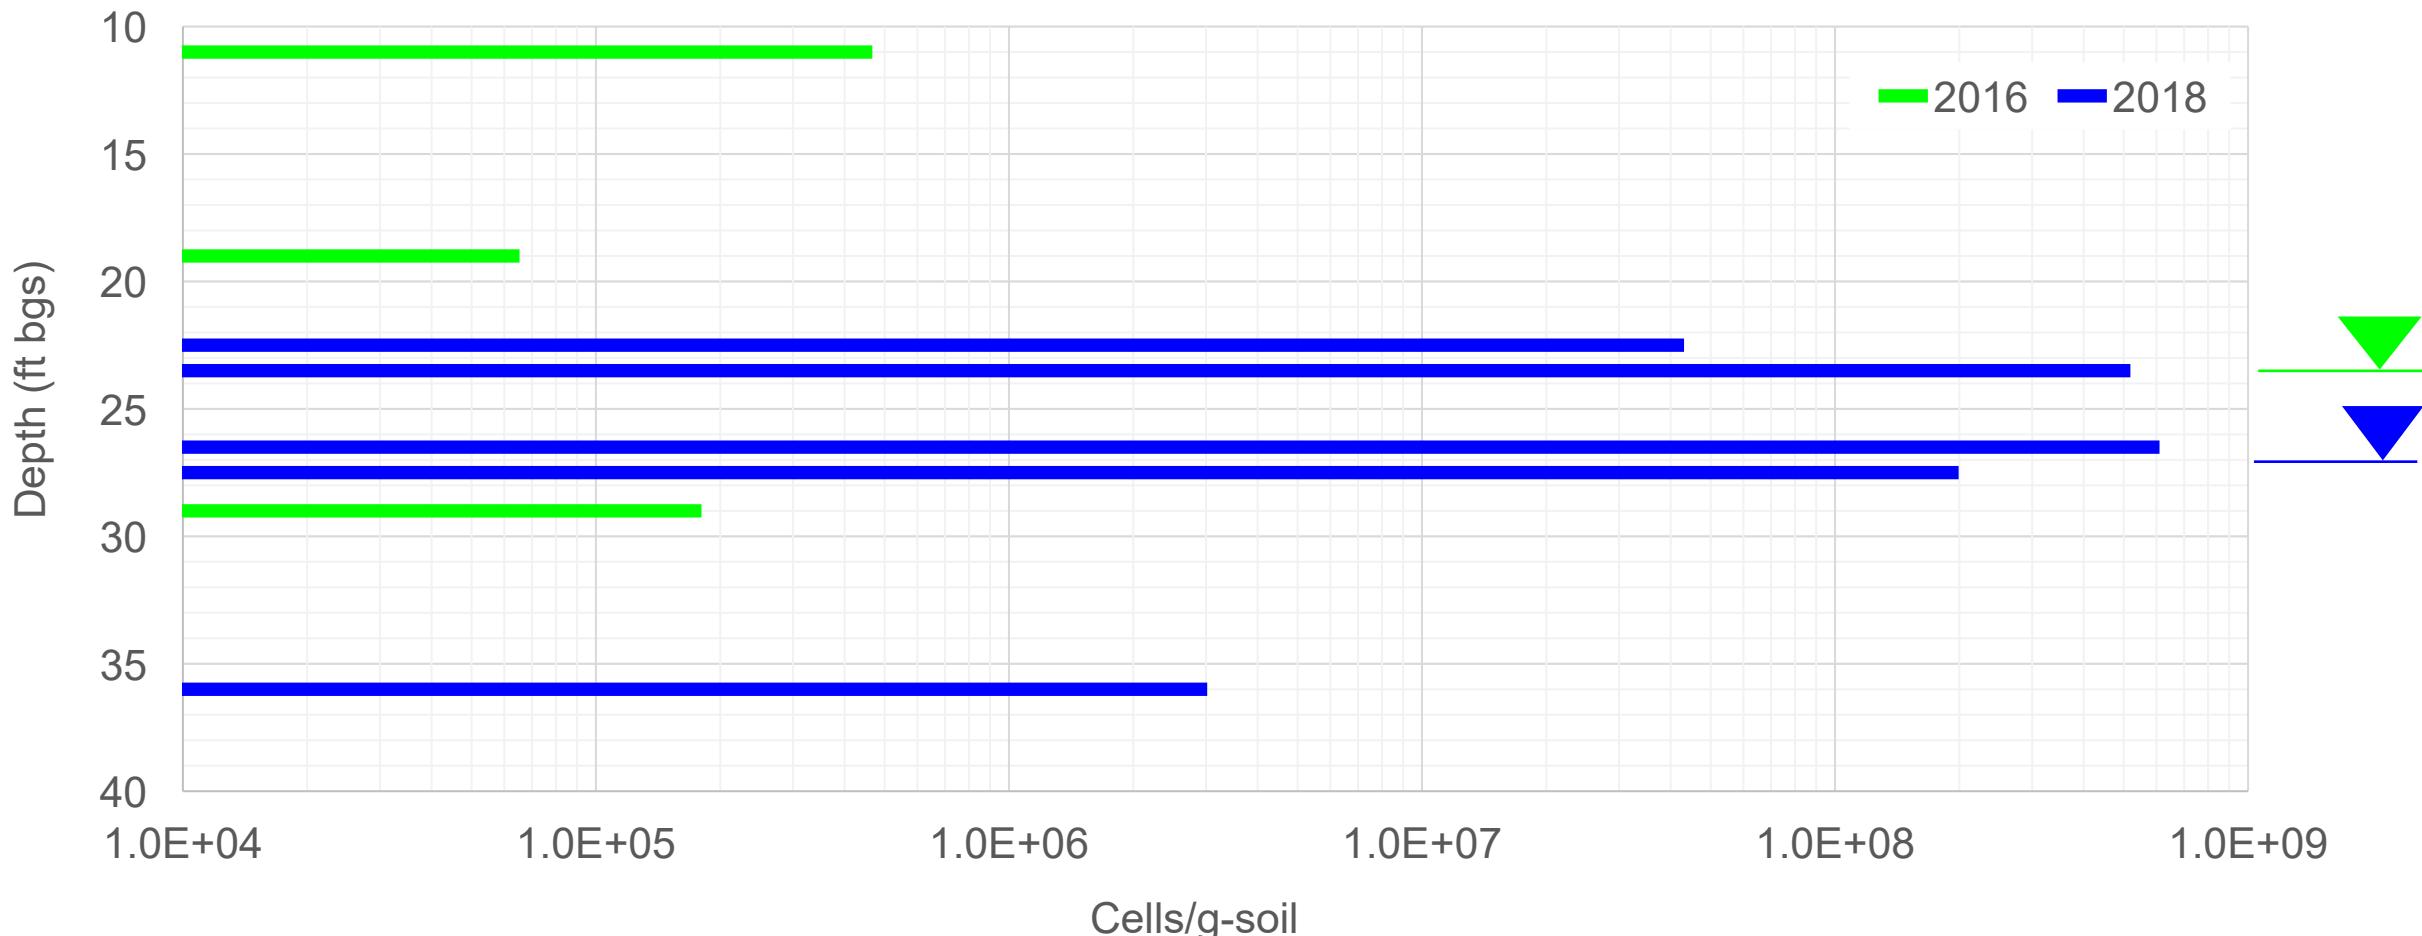

Evidence of Biodegradation

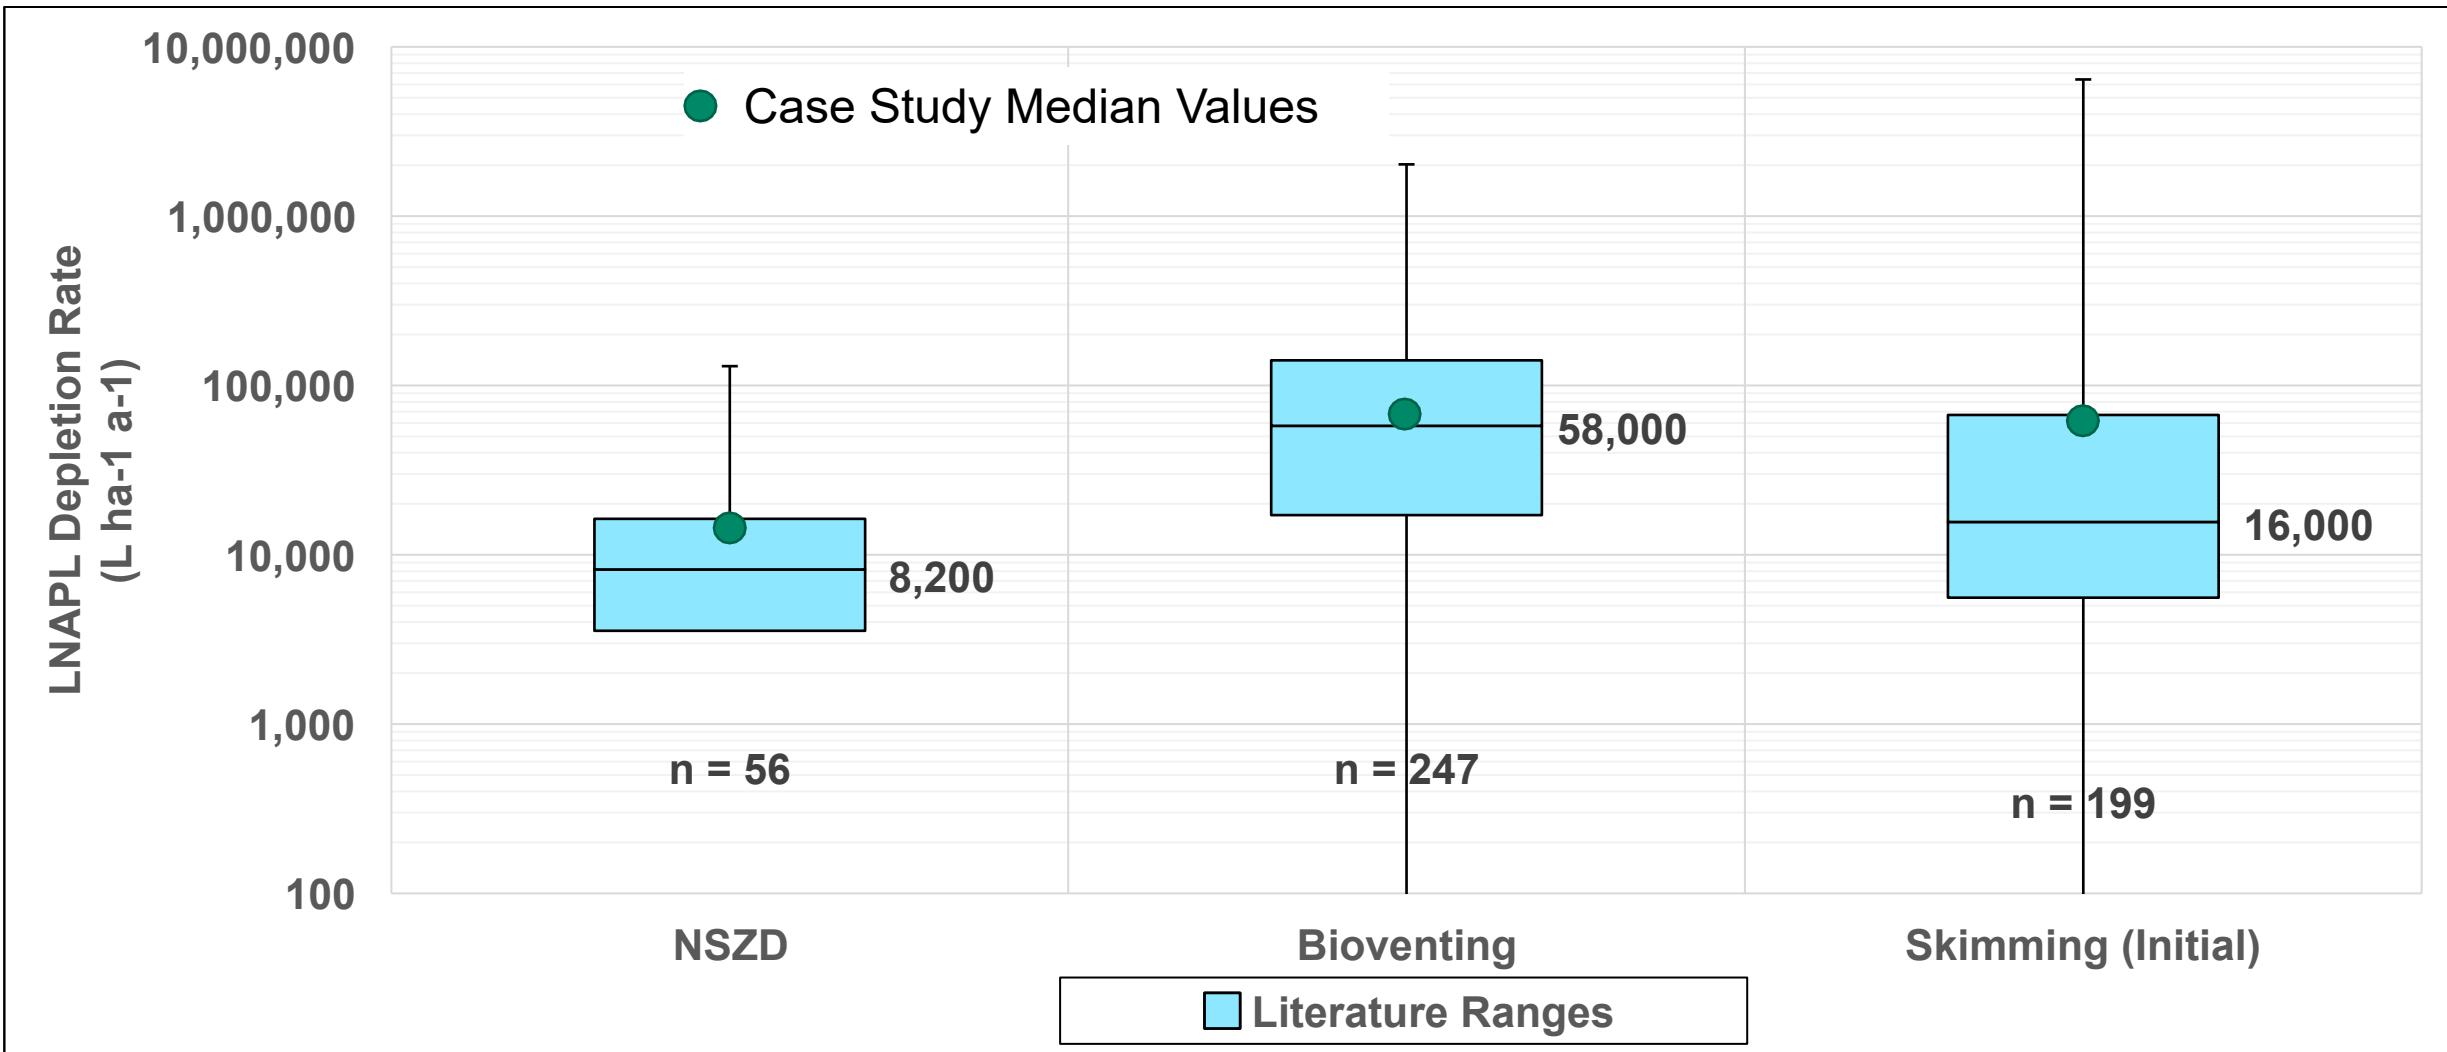

Evidence of Biodegradation

DNA - Aerobic BTEX Degraders
Baseline (2016) vs. April 2018

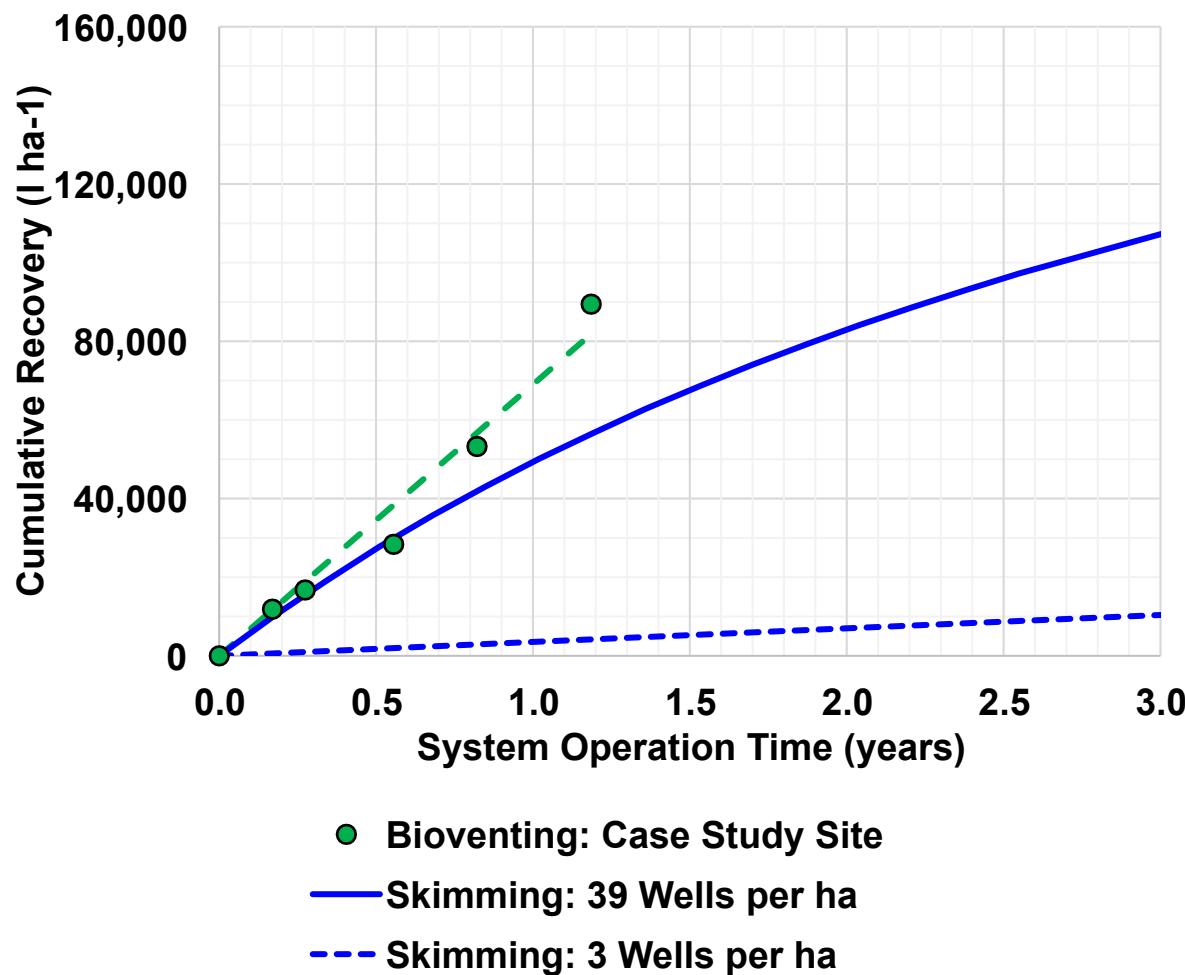

LNAPL Depletion Rates

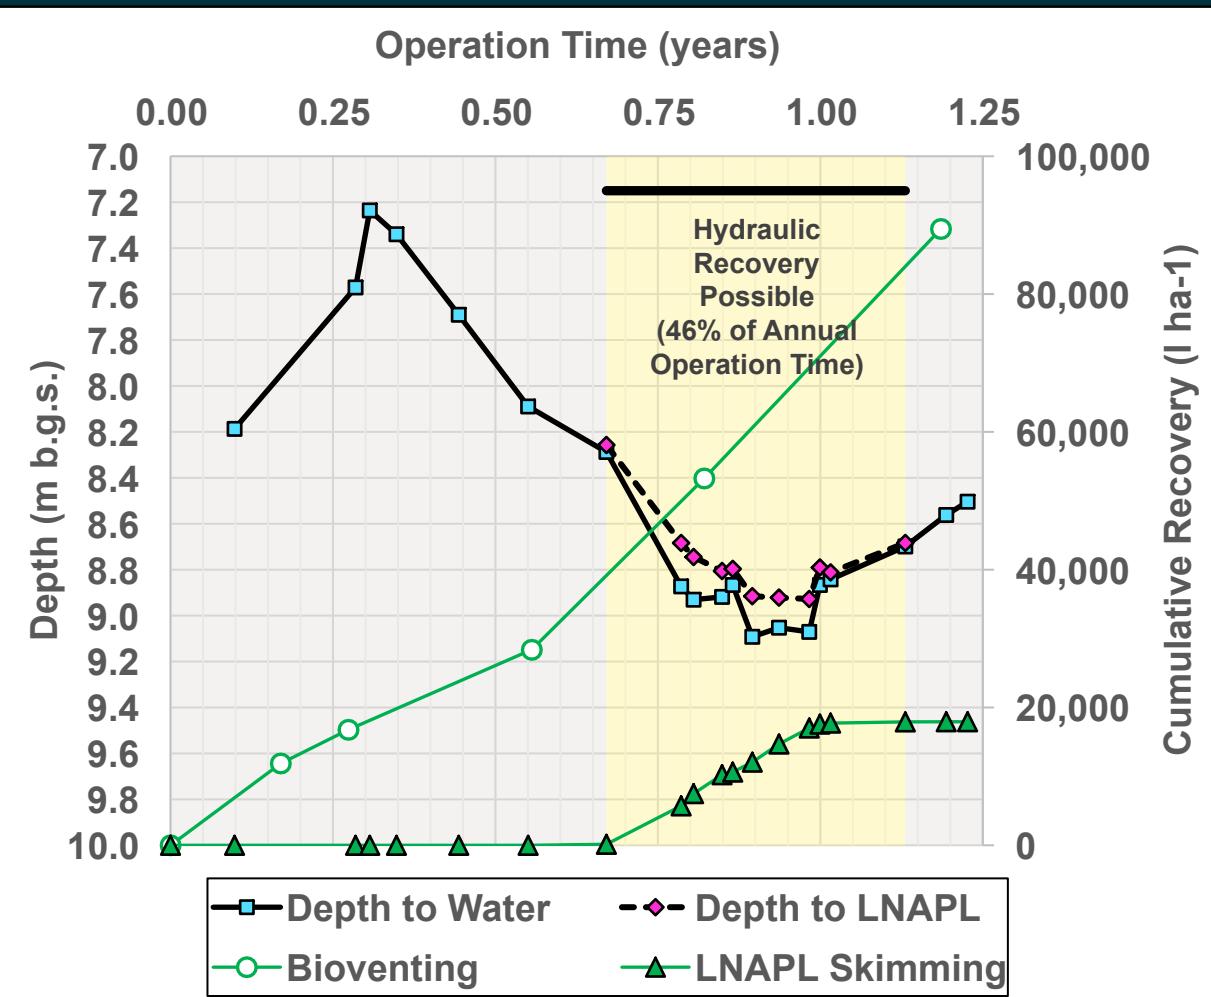

LNAPL Mass Depletion Skimming vs. Bioventing

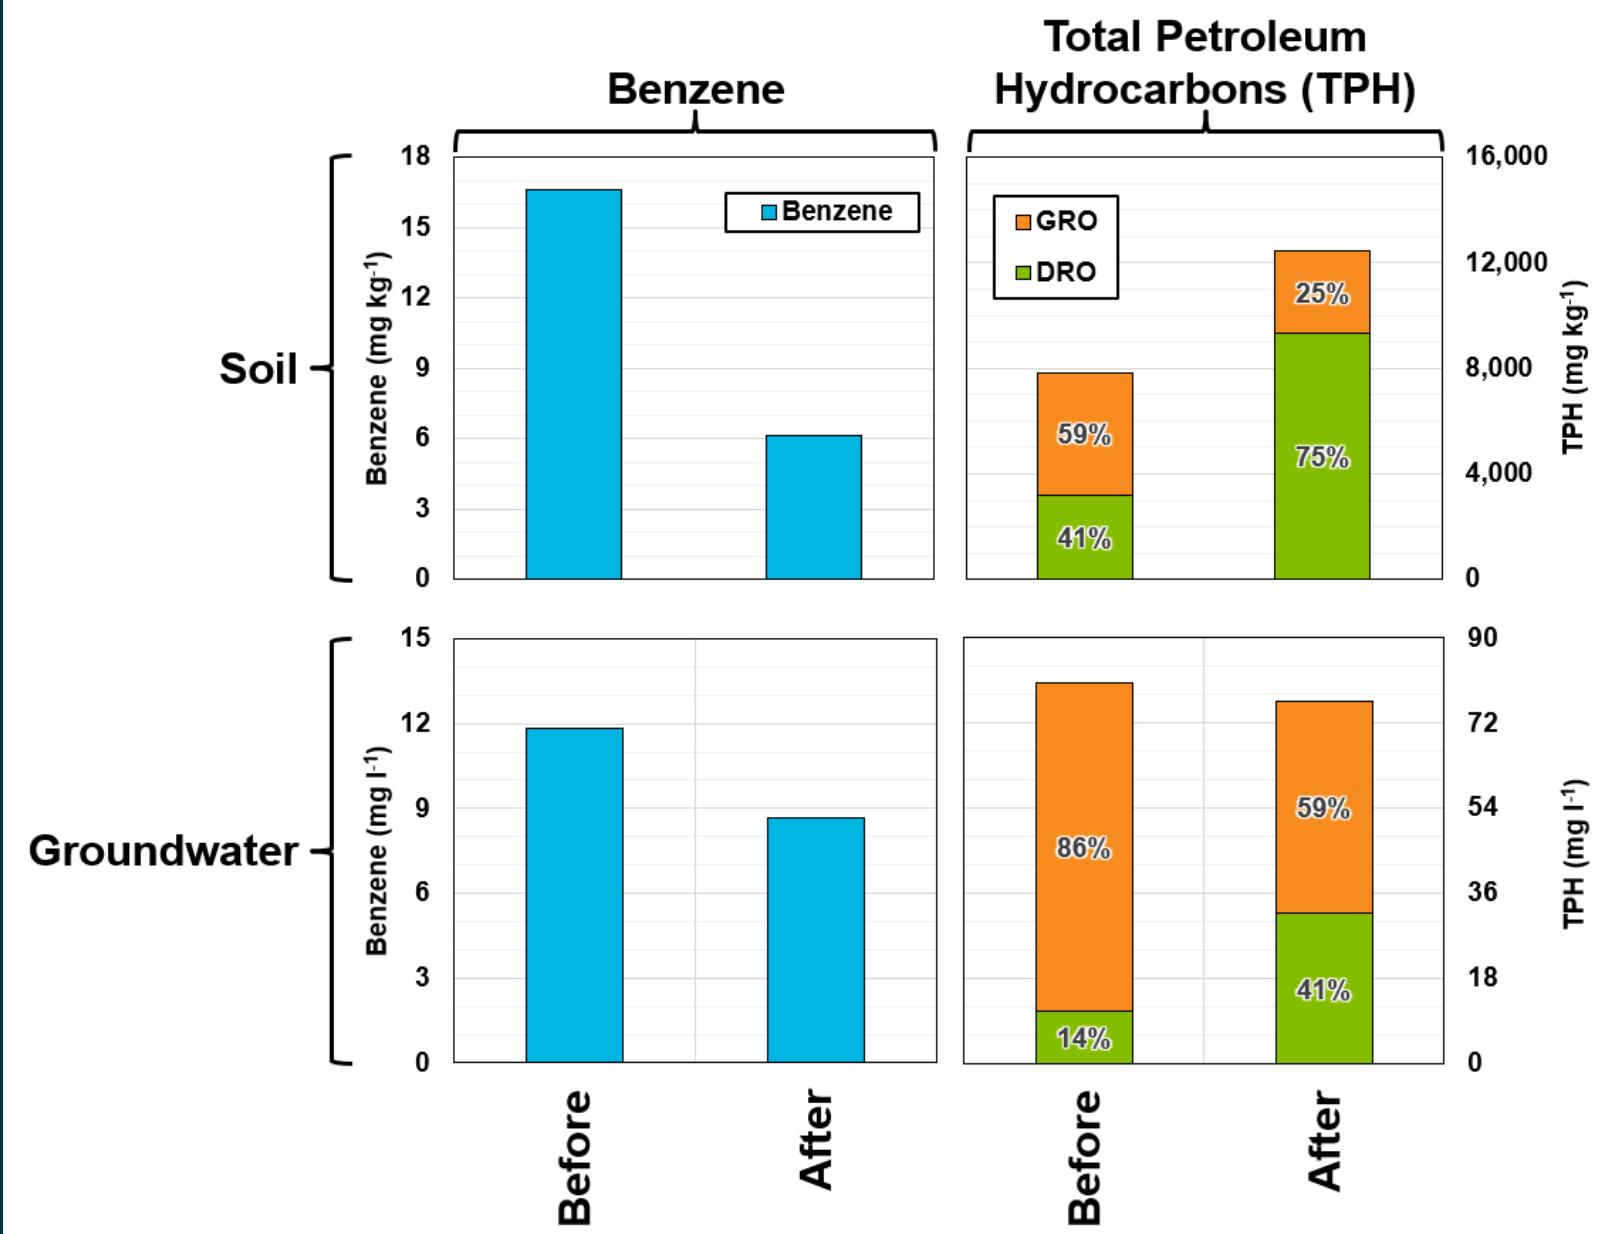

Bioventing vs. Modeled Skimming

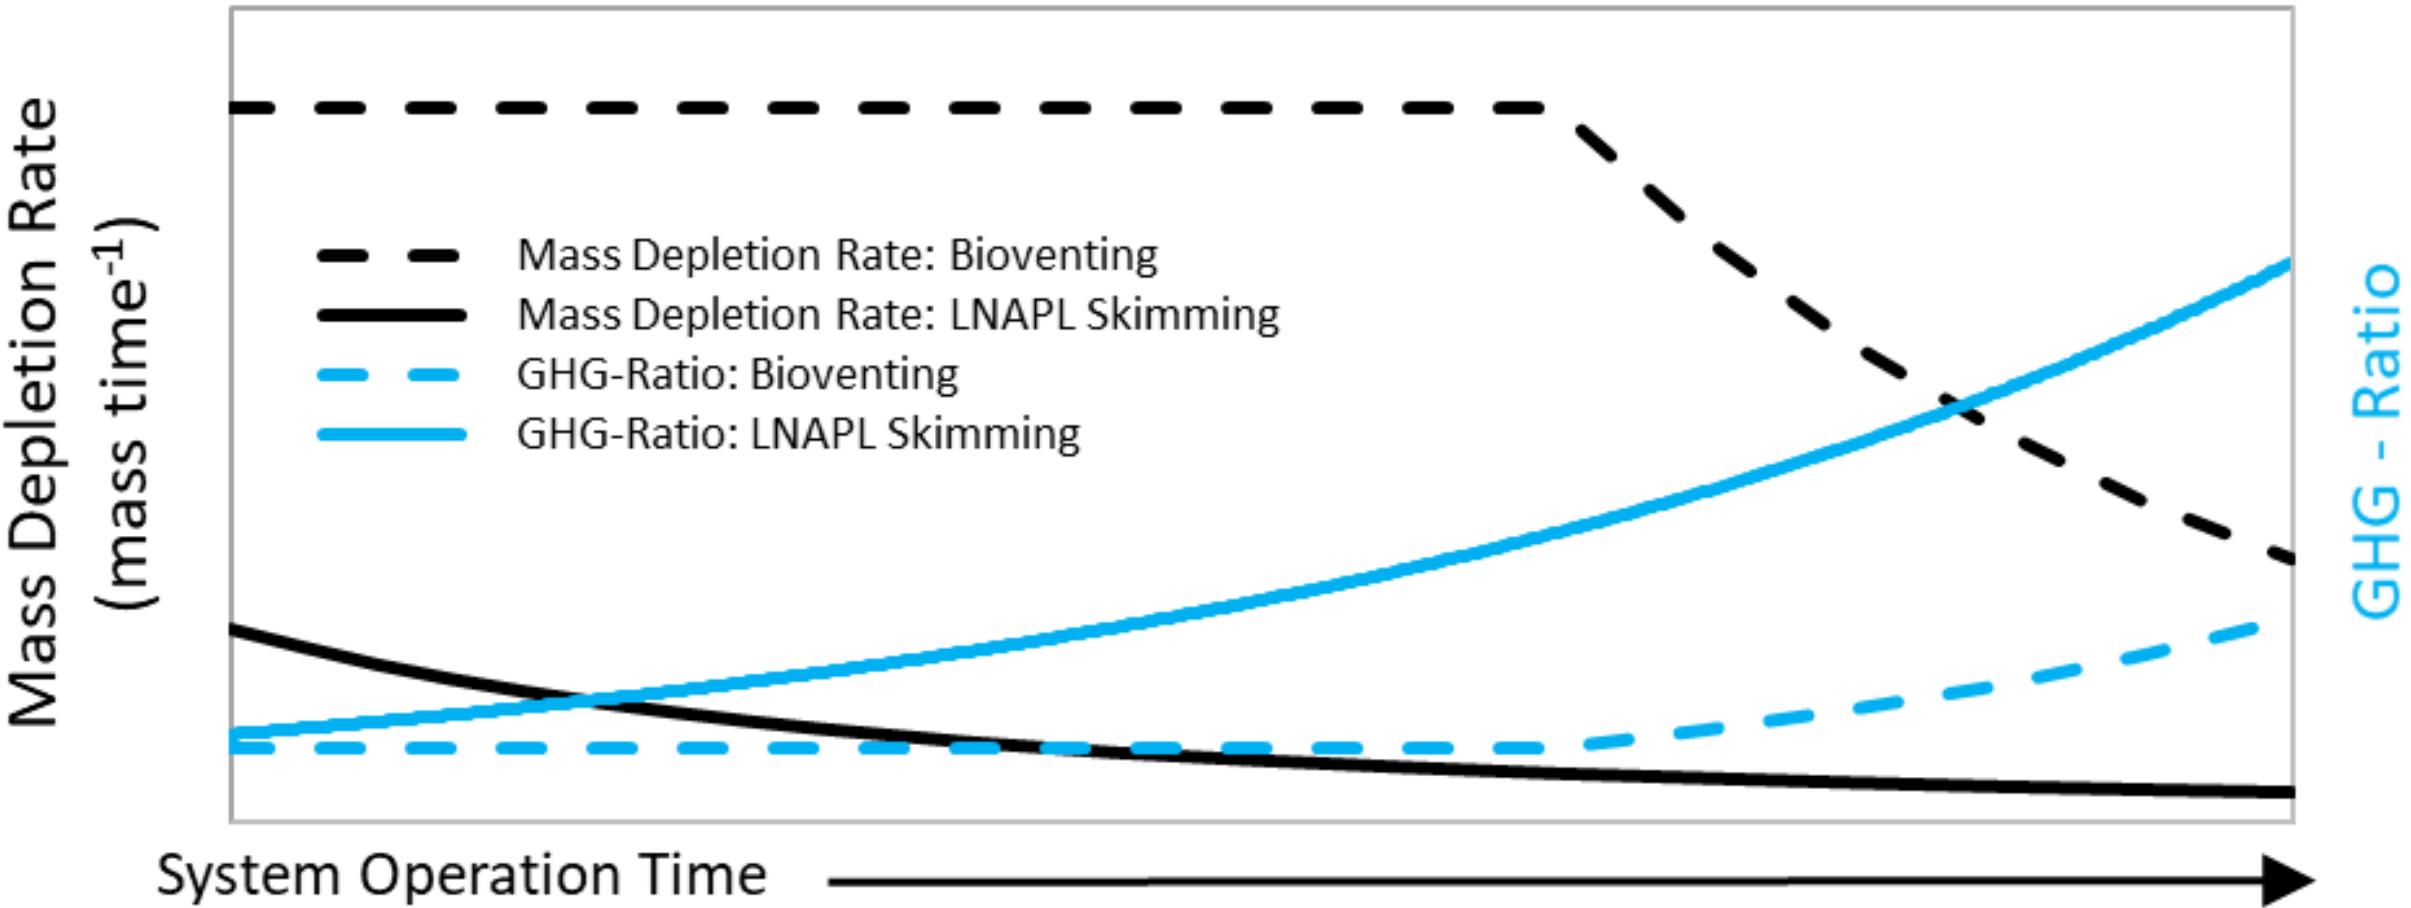

Bioventing vs. Realistic Skimming

Evidence of Compositional Change

Sustainability Considerations

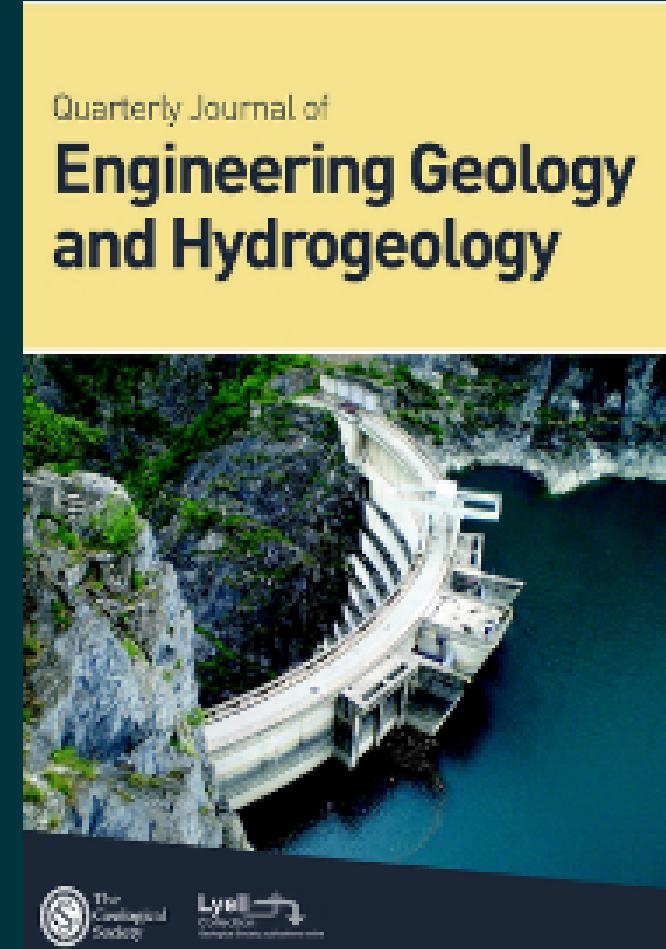

Summary

–Meeting MEP

- Bioventing is a viable remedy for addressing mobile LNAPL (if needed)
 - Not satisfactory to control imminent migration or dissolved phase concerns
- Bioventing can outperform hydraulic LNAPL recovery
 - Accessible smear zone is a key consideration

–Sustainability

- less infrastructure and OM&M
- greater mass removal over time

Bioventing Revisited: Efficacy of Enhanced Biodegradation for Sites with Mobile LNAPL
