Temperature  
Measurements

# Background + Research Questions

- Local utility experiencing unprecedented peak loads during Heat Dome
  - Looking for equitable strategy to manage grid capacity
- How do socio-demographic differences change behavioral response throughout an extreme heat event?
  - How do spatial differences in the City's built infrastructure lead to differential heat exposures?
- What are the statistical relationships between temperature, energy usage, and heat-related social variables?

# Air Conditioning Adoption

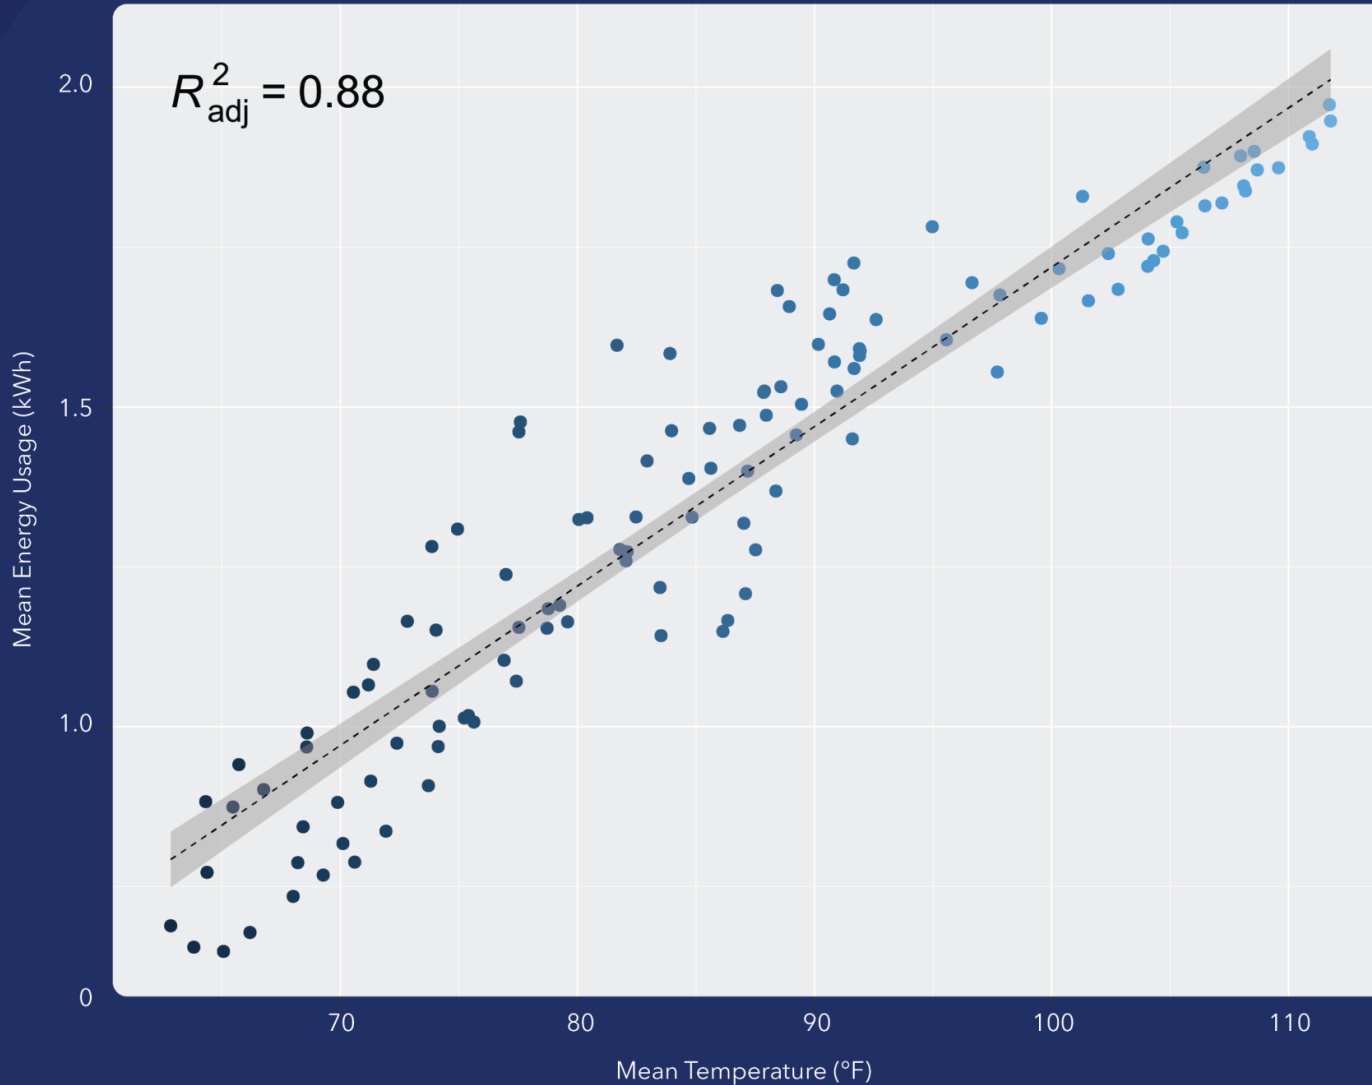

10% increase nationally in 2020

American Housing Survey <sup>4</sup>		
Year	% AC	% Change
2011	41.2	-
2015	69.9	69.7
2019	78.6	12.4

# 2021 Heat Dome

Mean Temperature vs Mean Energy Usage

Bottom 30% MHI vs. Energy Usage During Heat Dome  
June 23-30, 2021

## Median Household Income

During the Heat Dome, Census Blocks that have a higher average MHI used more energy.

Top 30% MHI vs. Energy Usage During Heat Dome  
June 23-30, 2021

At peak temperatures and usage,

the mean difference was  $\pm$

2.2kWh/hr

Low % POC (<3) vs. Energy Usage During Heat Dome  
June 23-30, 2021

## % People of Color

During the Heat Dome, Census Blocks that have a higher percentage of POC used more energy than their low percentage counterparts.

High % POC vs. Energy Usage During Heat Dome  
June 23-30, 2021

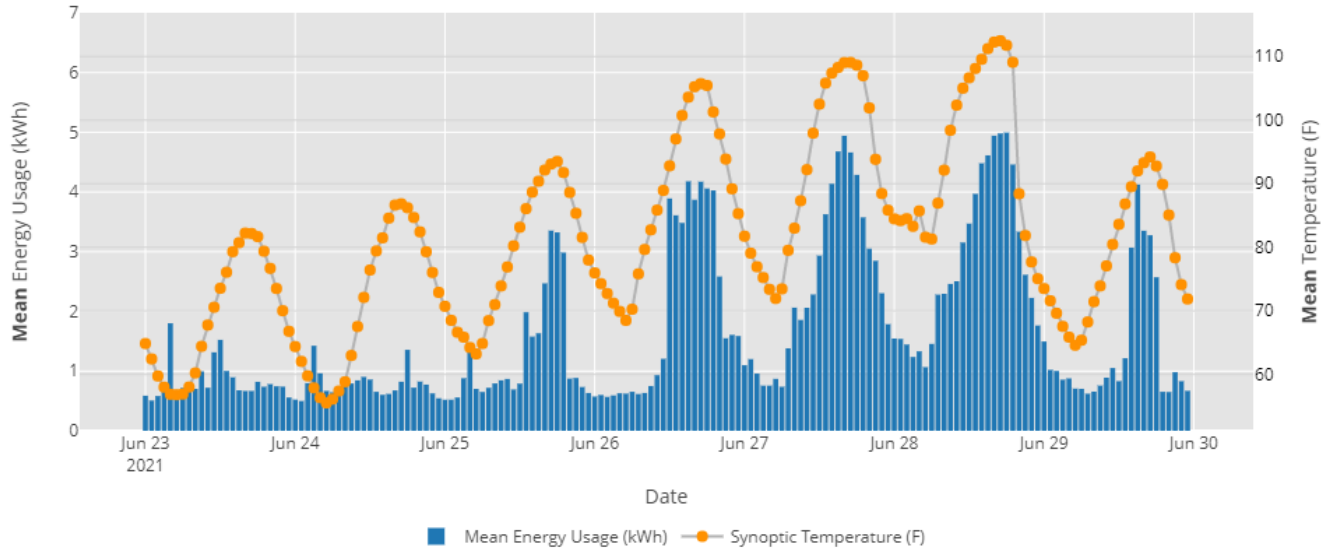

At peak temperatures and usage,

the mean difference was  $\pm$

2kWh/hr

Low % Canopy vs. Energy Usage During Heat Dome  
June 23-30, 2021

## Canopy

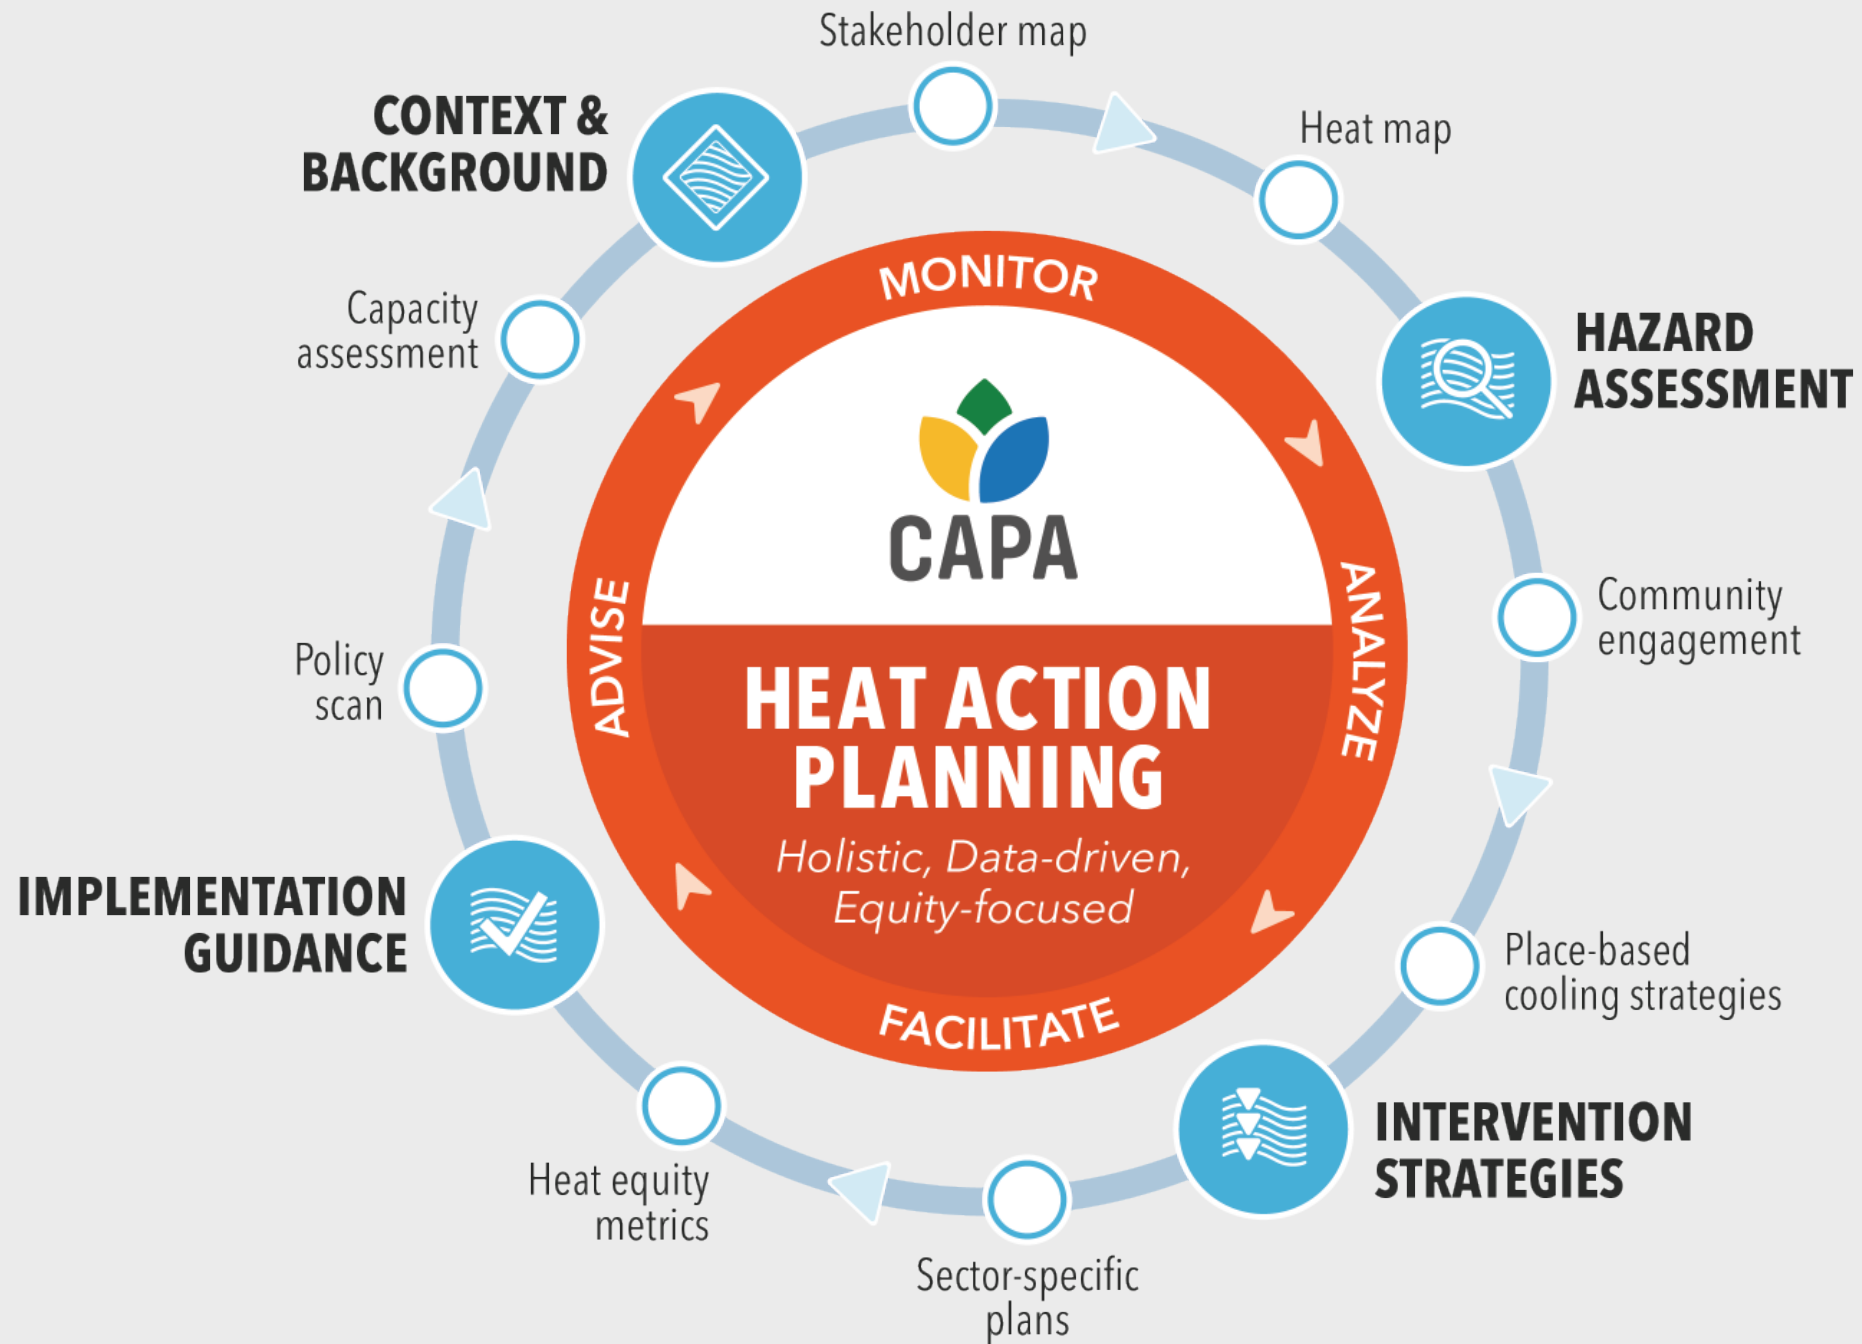

During the Heat Dome, Census Blocks that have a higher average % Canopy used less energy.

High % Canopy vs. Energy Usage During Heat Dome  
June 23-30, 2021

At peak temperatures and usage, the mean difference was  $\pm 3\text{kWh/hr}$
