Teamwork makes the dream work!

Background

■ Issue

- Tools to manage water risk require sustained funding to integrate climate-based and regional assessments that inform adaptation and resiliency strategies.

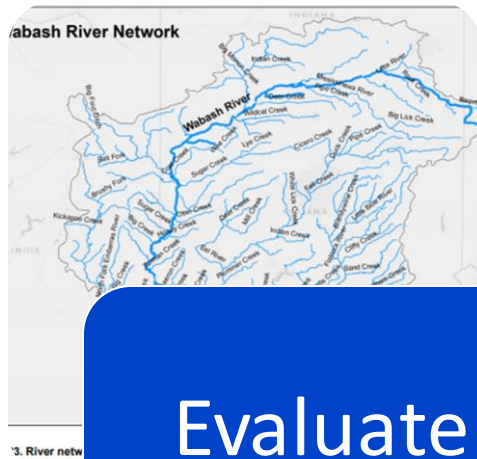

■ Objectives

- Facilitate response to emerging water management stakeholder issues
- Integrate climate assessments into water supply/quality models
- Give insights on regional climate risks and adaptation strategies to support long range planning

Steps in the Analysis

Evaluate
Hydrologic
Models

n=0	2	1	1
1	4	2	2
0	5	4	1
1	4	2	1
0			

Design Risk
Framework

Develop
Adaptation
Strategies

Linking Research for Strategic Planning and Tactical Outcomes

Step 1a: Evaluate Hydrological Models

■ SWAT

- Hydrologic and water quality
- Detailed representation of actual land uses & mgmt. practices
- Applicable to many regions
- Can incorporate land use change in same simulation
- Can model extreme events
- Easily available with good support

■ WARMF

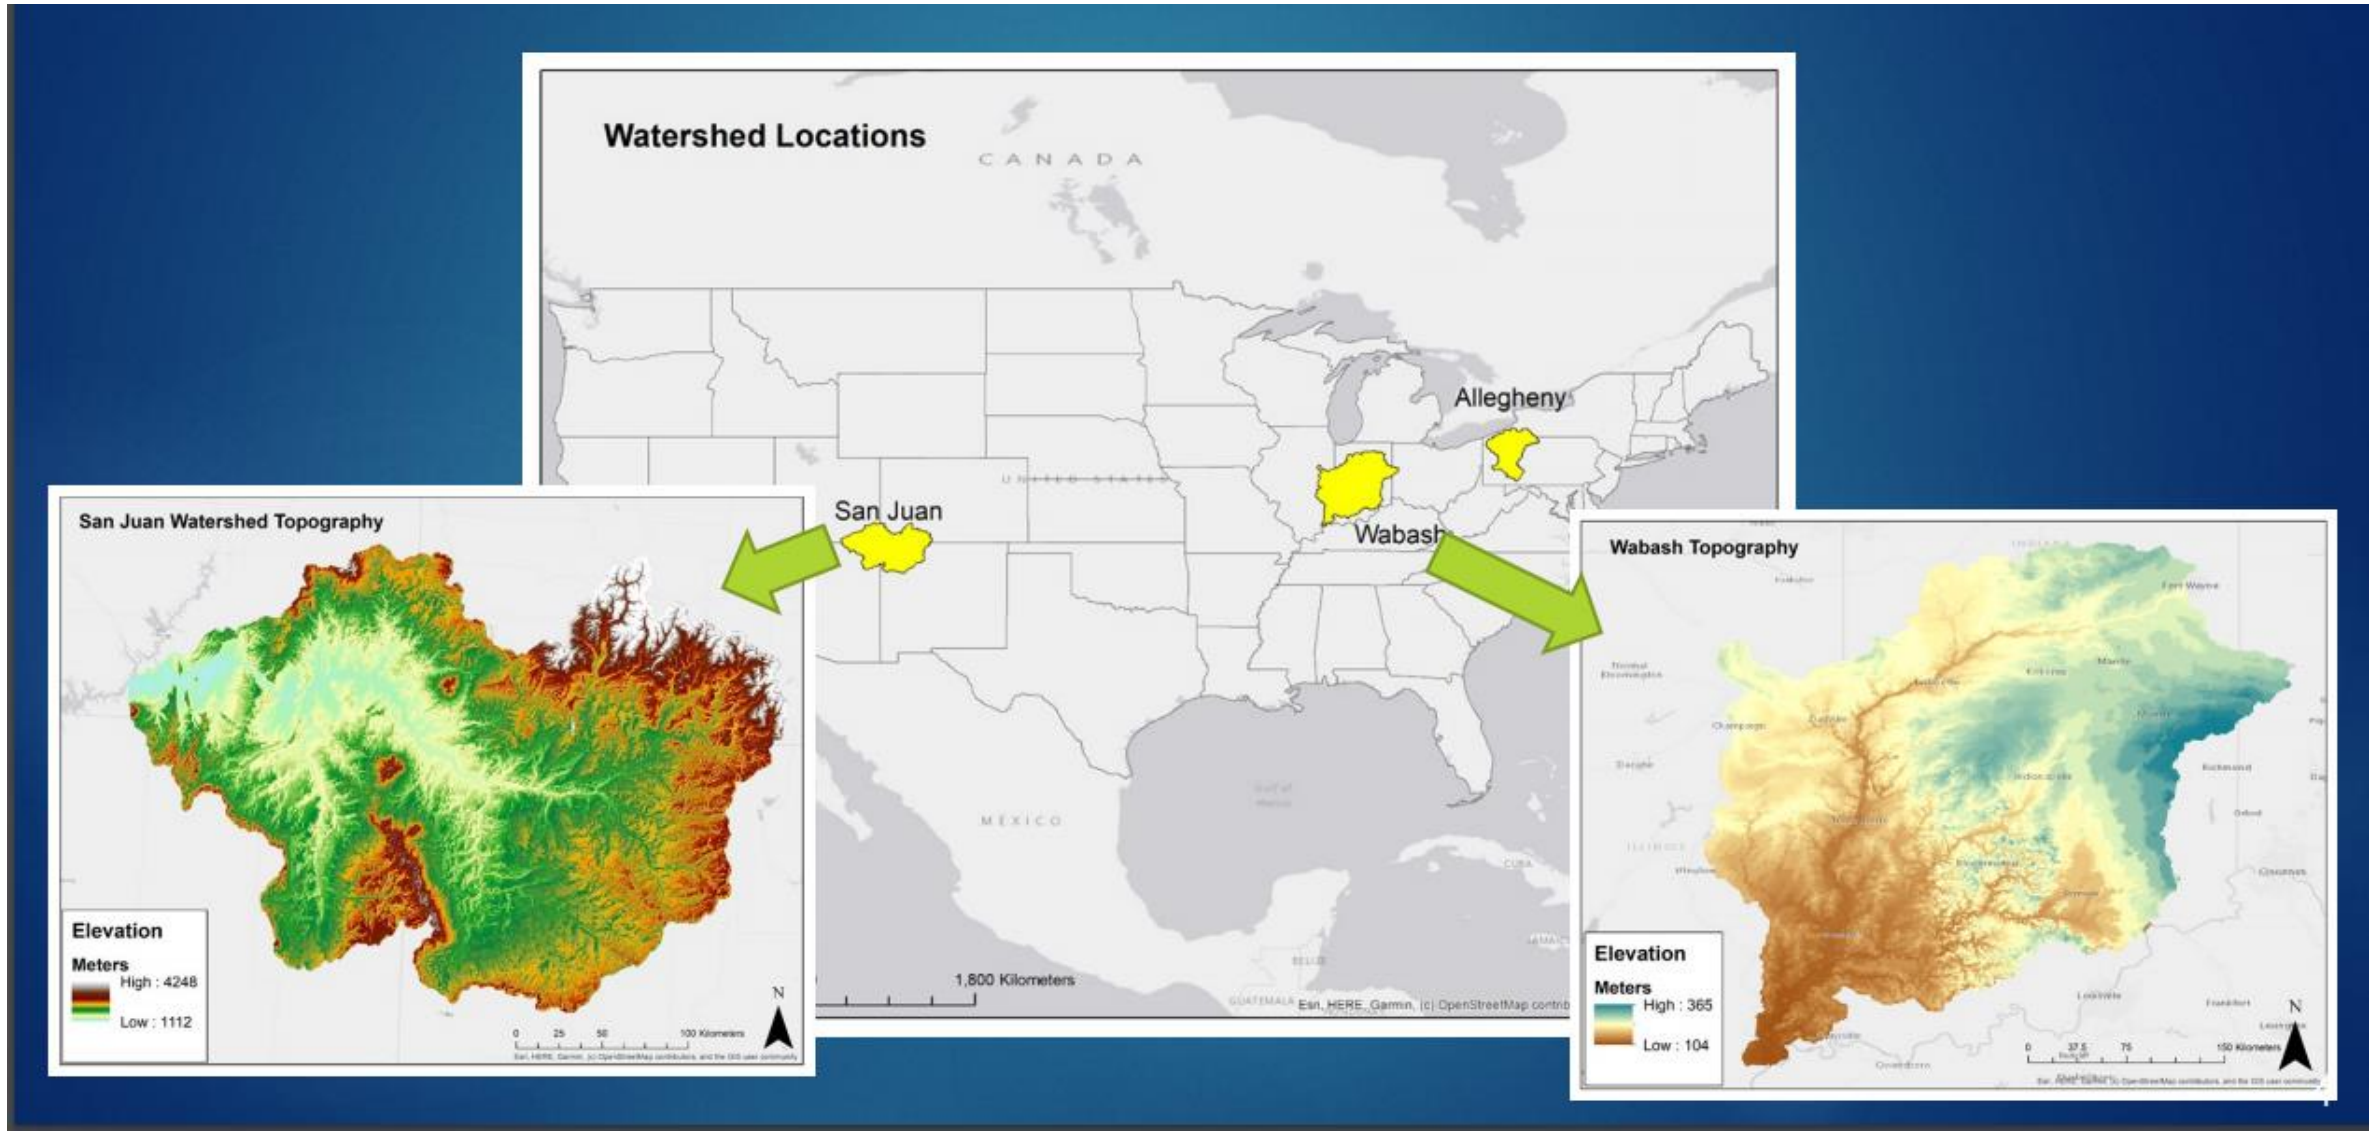

- Hydrologic and water quality
- Very good representation of actual land uses
- Applicable to many regions
- Can incorporate land use change in simulation in series
- Can model extreme events
- Available with good support

• MIKE SHE

- Hydrology
- Water quality requires additional programming
- Very good representation of actual land uses
- Applicable to many regions
- Need separate simulations for land use change
- Can model extreme events
- Available, with a significant monthly fee

2020 EPRI Report: Evaluation of Hydrological Models for Climate-based Assessments (#3002019495)

Step 1b - Hydrological Modeling

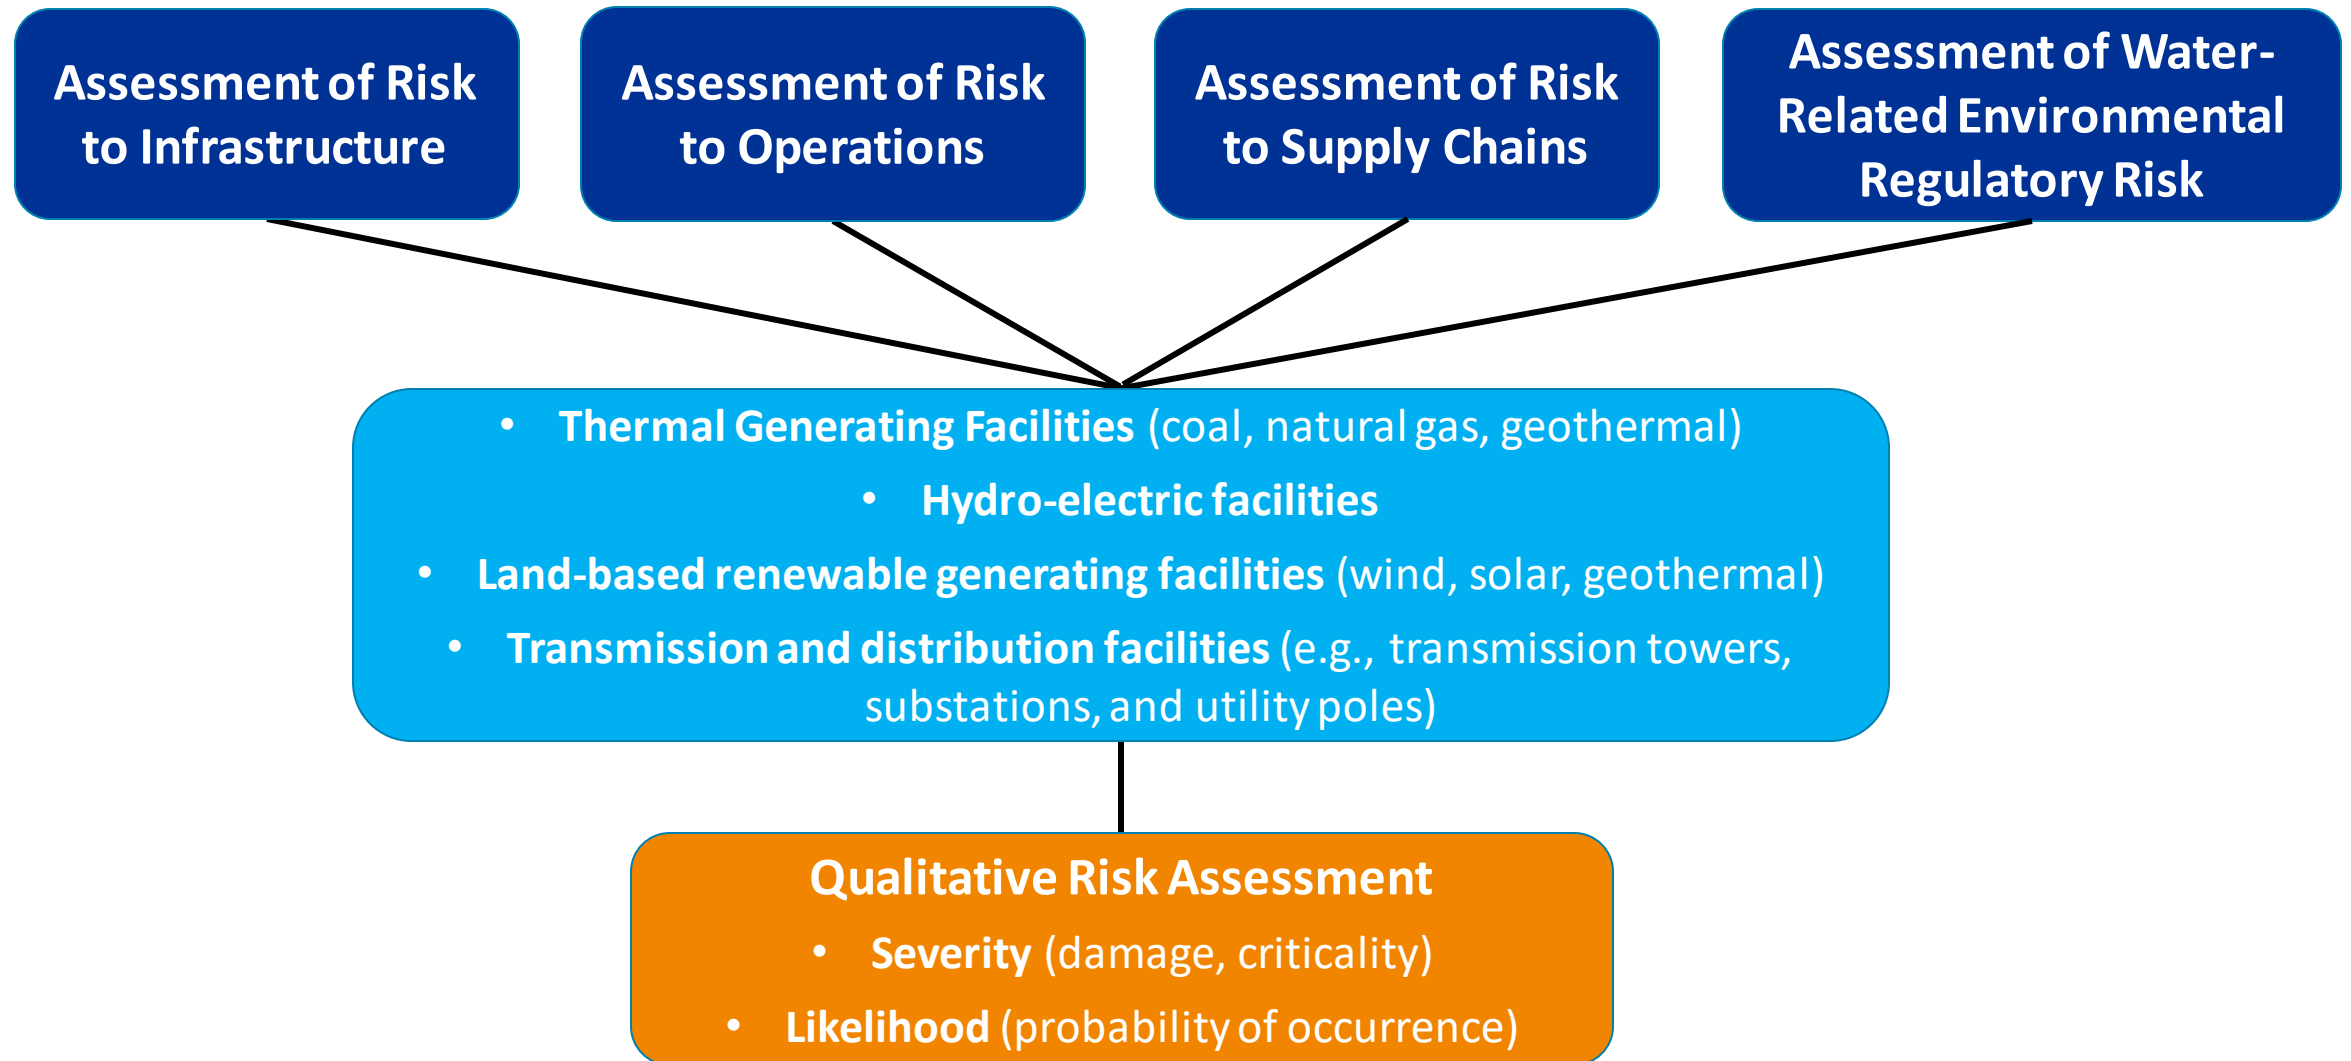

Data Used

- GCMs selected based on best match of historical climate
 - GFDL ESM2 (USA)
 - Hadley GEM2 (UK)
 - MRI CGCM3 (Japan) or Can ESM2 (Canada)
- IPCC projections
 - RCP4.5 (mid-level emissions)
 - RCP8.5 (high-level emissions)
- Downscaling method – Dynamic vs Statistical

Step 2a - Characterize Risk

Qualitative Risk Identification and Characterization

Very Likely	n=0	2	1	1
Likely	1	3	2	2
Moderately Likely	0	5	4	1
Less Likely	1	4	2	1
Unlikely	0	1	0	0
	Positive Impact	Low Severity	Medium Severity	High Severity

**31 risks
identified
in total**

Step 2b – Quantify Risk

Hydropower example from the San Juan Basin

Cumulative Lost Revenue - Current Residential Rate (FEUS)

- HADGEM2 - RCP 4.5
- HADGEM2 - RCP 8.5
- GFDL EM2M - RCP 4.5
- GFDL EM2M - RCP 8.5
- MRI CGCM RCP - 4.5
- MRI CGCM RCP - 8.5

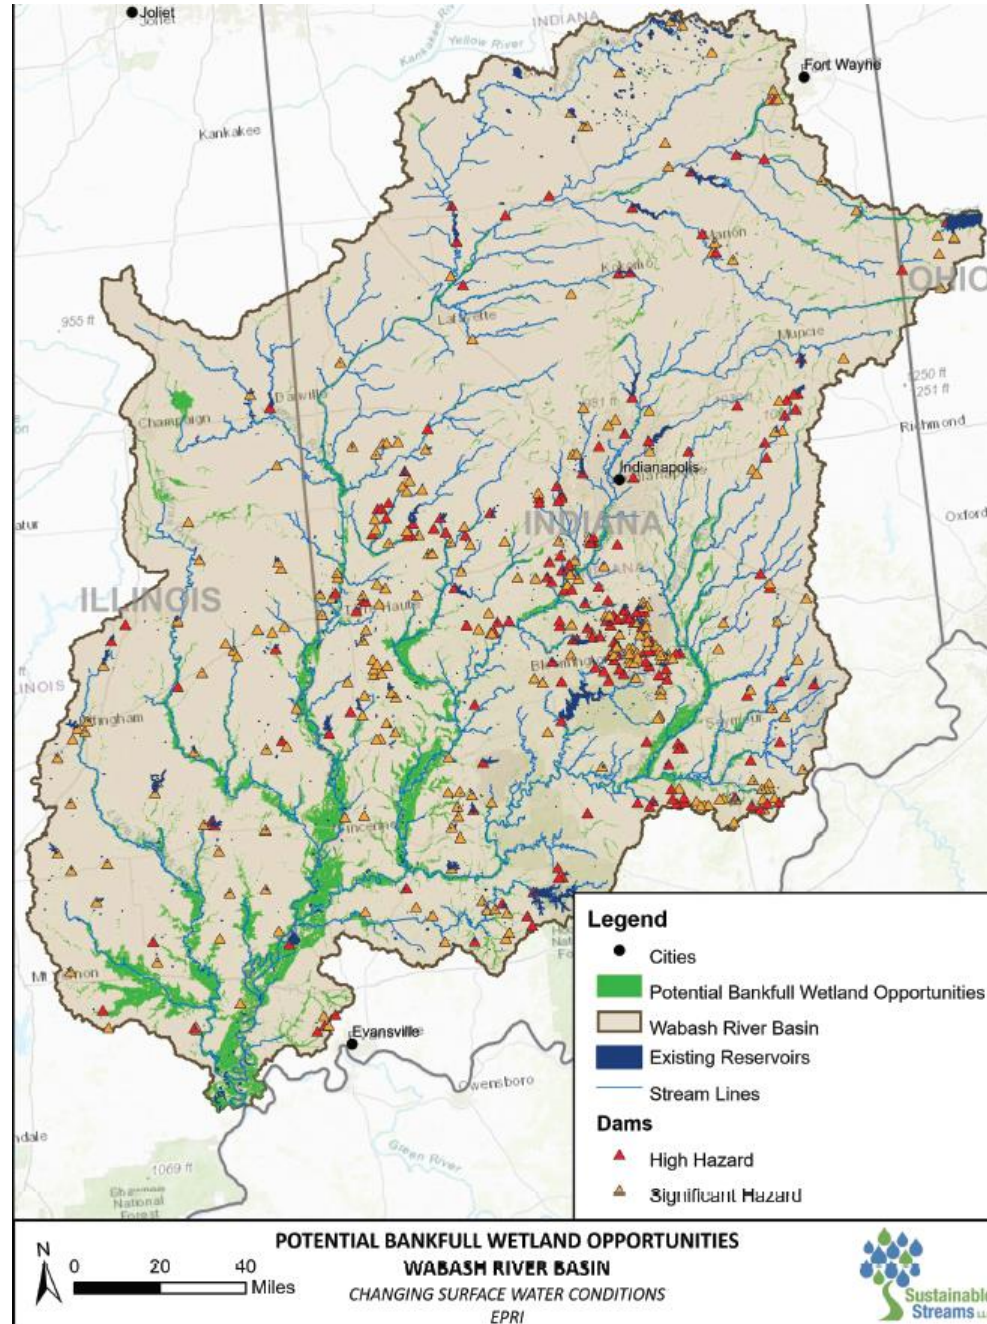

Notes:

1. Data from City of Farmington, NM Electric Utility rate study
2. Revenue evaluated at residential rate of \$0.10/ kWh
3. Power generation from USACE 2011 FEIS

Step 3a – Identify Adaptation Strategies

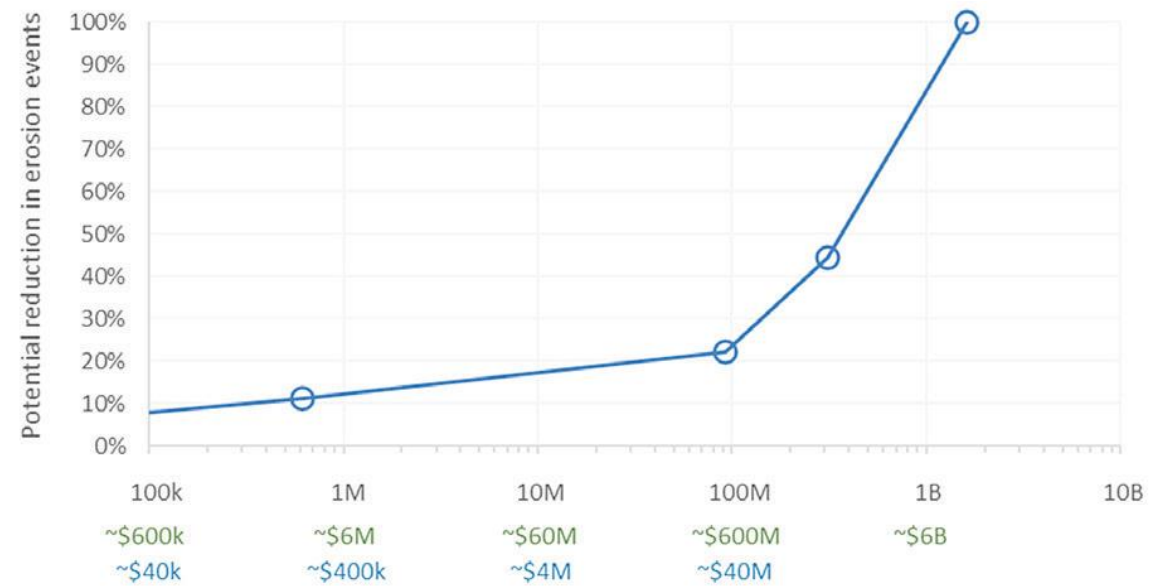

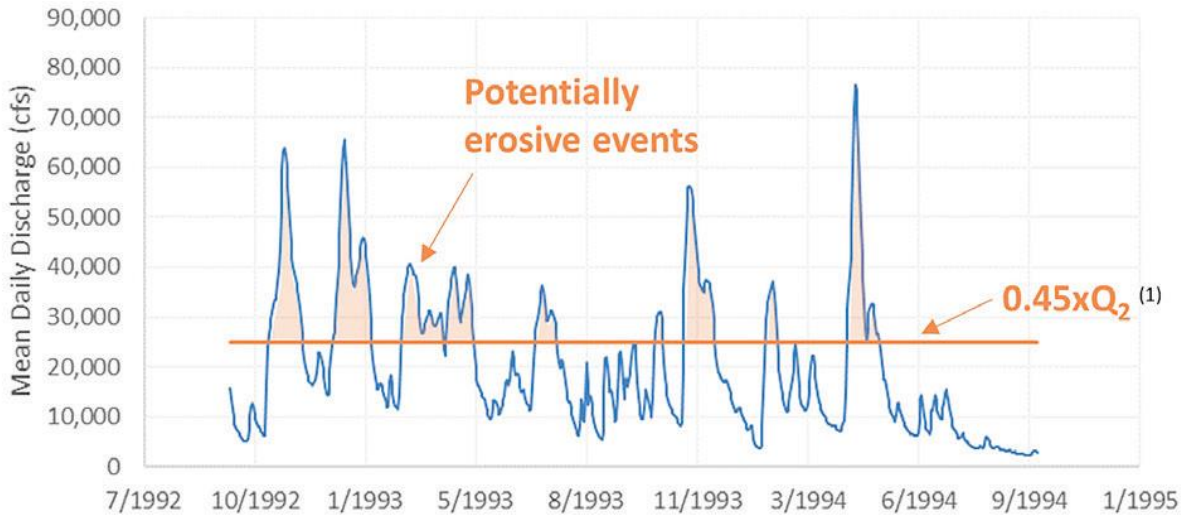

- San Juan River Basin
- Wabash River Basin
- Allegheny River Basin

- Optimization of Existing Storage
- Bankfull Wetlands
- Beaver Reintroduction
- Hand-Placed Logs

Step 3b – Quantify Adaptation Strategies

	~250k m ³	~1.25M m ³	~25M m ³	~120M m ³
	~\$1.5M	~\$7.5M	~\$150M	~\$750M
Bankfull Wetlands – planning-level excavation cost of \$6.20/m ³ (\$4.75/CY) with free topsoil haul off				
	~\$100k	~\$500k	~\$10M	~\$50M
Beaver Reintroductions – planning-level cost of \$2,500 per imported colony with each colony creating ~6,200 m ³ (~5 acre-ft) of storage				
	~\$15M	~\$75M	N/A	N/A
Hand-placed Logs – planning-level cost of \$5.75/m (\$1.75/ft) with volunteer/student labor and professional guidance				
				
Existing Reservoir Optimization – feasibility and cost will vary by watershed/reservoir

Manuscripts in progress

A blue-tinted photograph of four people standing in a row. From left to right: a man with glasses and curly hair wearing a white lab coat; a man with glasses wearing a white lab coat; a woman wearing a white hard hat and a dark jacket; and a man with glasses and a beard wearing a light-colored button-down shirt. They are all looking towards the right side of the frame.

Together...Shaping the Future of Energy[®]
